Concerning the use of these cavities the doctor conjectures, that they are a kind of appendage to the lungs; and that like the bags continued through the bellies of amphibious animals, they serve as a kind of reservoirs of air. They assist birds during their flight, which must be apt to render frequent respiration difficult. He further insinuates, that this construction of the organs of respiration may assist birds in singing; which, he thinks may be inferred from the long continuance of song between the breathings of a canary bird. On tying the trachea of a cock, the animal breathed through a canula introduced into his belly; another through the os humeri, when cut across; and a hawk through the os femoris. In all these cases the animals soon died. In the first, the doctor ascribes the death to an inflammation of the bowels; but in the last, he owns it was owing to difficult breathing. What took place, however, was sufficient to show that the animals really did breathe through the bone.

their abdomen with air, and expanding their tail, they come to make the posterior part of their bodies considerably higher; and thus they fly with their bodies near in an horizontal situation. Hence we find, that if their necks are kept from being stretched out, or if you cut away their tails, they become incapable of flying any considerable way. The largeness of the wings in different fowls varies, according to the occasions of the creature. Thus birds of prey, who must fly a considerable way to provide their food, have large strong wings; whereas domestic birds, who find their nourishment almost every where, have very short and but small wings. The best account of the manner of progression of fowls, is given by Alfonso Borelli in his treatise *De motu animalium*; and in the "Religious Philosopher" we have Borelli's doctrine stript pretty much of its mathematical form. The posterior extremities are so situated as to make us at first think they would be in continual hazard of falling down forwards when they walk; but this is prevented by their holding up their heads and necks; and when they have occasion for climbing up a steep place, they stretch out their head and necks forwards. Thus we may observe a goose, entering a barn-door, where generally there is an ascending step, to stretch out its neck, which before was raised, and incline its body forwards; this is laughed at by the common people, who ascribe it to a piece of folly in the goose, as if afraid of knocking its head against the top of the door.

Carnivorous animals are provided with strong crooked claws for the catching their prey; water-fowls use them for swimming; and principally for this purpose have a strong firm membrane interposed betwixt the toes. There is a beautiful mechanism to be observed in the toes of fowls, which is of considerable use to them; for their toes are naturally drawn together or bended when the foot is bended; this perhaps proceeds from the tendons of the toes passing over in them what is analogous to our heels, and when the foot is bended must consequently be much stretched; and since they are inserted into the toes, must of necessity bend them when the foot is bended; and when the foot is extended, the flexors of the toes are again relaxed, and they therefore expanded. This is of great use to water-fowls; for had there been no such contrivance as this, they must have lost as much time when they pulled their legs in, as they had gained by the former stroke; but as the parts are now framed, whenever the creature draws in its foot, the toes are at the same time bended and contracted into less space; so that the resistance made against the water is not near so great as before: on the contrary, when they stretch their foot their toes are extended, the membrane betwixt them expanded, and consequently a greater resistance made to the water. Again, such fowls as live mostly in the air, or have occasion to sustain themselves on branches of trees in windy weather, and even in the night-time when asleep, while all their muscles are supposed to be in a state of relaxation; such have no more to do but lean down the weight of their bodies, and their toes continue bended without any muscles being in action; and whenever they would disentangle themselves, they raise up their

bodies, by which their foot, and consequently their toes, are extended.

Carnivorous fowls have their beaks long, sharp and crooked; the domestic fowls, such as the hen kind, &c. have strong short beaks, commodiously fitted to dig up and break their food; the water-fowls again have long or very broad scoop-like beaks, which is most convenient for them. The sternum of fowls is much larger proportionally than the human, and has a ridge rising in its middle for the more commodious origin of the muscles that move the wings. It is also less moveable than ours; for had it been very moveable, a great deal of the force employed for moving the wings would at every contraction of the muscles have been lost, or else some other muscles must have come in play to keep firm the sternum; but this additional weight would have been inconvenient for their progression.

What other things are most remarkable in the structure of the several viscera, we shall consider in that common domestic animal, the cock or hen, and afterwards observe the difference of their viscera chylipoietica from a carnivorous fowl.

CHAP. V. *The Anatomy of a Cock.*

THE œsophagus of this creature runs down its neck somewhat inclined to the right-side, and terminates in a pretty large membranous sac, which is the ingluvies or crop where the food is macerated and dissolved by a liquor, separated by the glands which are easily observed every where on the external surface of this bag. The effect of this maceration may be very well observed in pigeons, who are sometimes in danger of being suffocated by the pease, &c. they feed upon, swelling to such an immense bulk in their ingluvies, that they can neither get upwards nor downwards. If it be a favourite fowl, it might be preserved by opening the sack, taking out the pease and sewing up the wound.

The food getting out of this sac, goes down by the remaining part of the œsophagus into the ventriculus succenturiatus or infundibulum peyer, which is a continuation of the gullet with more numerous glands, which separate a liquor to dilute the food still more, which at length gets into the true stomach or gizzard, which consists of two very strong muscles covered externally with a tendinous aponeurosis, and lined on the inside by a very thick firm membrane, which we evidently discover to be a production of the cuticula. This might have been proved in some measure *a priori*, from taking notice that this membrane, which in chicks is only a thin slight pellicle, by degrees turns thicker and stronger, the more attrition it suffers: but there is no other animal substance, so far as we know, which grows more hard and thick by being subjected to attrition, excepting the cuticula. Hence may be drawn some kind of proof of what hath been affirmed concerning the tunica villosa of the stomach, and intestines in the human body, viz. that it was only a continuation of epidermis. Nay, all the hollow parts of the body, even arteries, veins, &c. seem to be lined vessels with a production of this membrane or one analogous to it. The use of this internal coat of the stomach of fowls is to defend the more tender parts of that viscus

peculiar mechanism of the toes of fowls.

from the hard grains and little stones those creatures take down.

The digestion of these animals is performed, partly at least, by attrition, as is evinced by many experiments. We see them daily take down considerable numbers of the most solid rugged little flints they find, and these can serve for no other purpose than to help the trituration of their aliments. After these pebbles by becoming smooth are unfit for this office, they are thrown up by the mouth; hence fowls that are long confined, though never so well fed, turn lean for want of these stones to help their digestion; but this was put beyond all dispute by Mr Tavvry, who gave a species of metal to an ostrich, convex on one side, and concave on the other, but carved on both; and opening the creature's body some time after, it was found that the carving on the convex side was all obliterated, while the engraved character remained the same as before on the concave side which was not subjected to the stomach's pressure; which could not have happened had digestion been performed by a menstruum, or any other way whatsoever; but may be easily solved by allowing a simple mechanical pressure to take place.

108
Duodenum.

The duodenum begins pretty near the same place, at which the œsophagus enters; yet notwithstanding the vicinity of these two tubes, the aliments are in no danger of getting out before they are perfectly digested, by reason of a protuberance or septum medium betwixt the orifices; and in those creatures who have such a strong muscular stomach, it is a matter of great indifference, whether the entry of the œsophagus or pylorus be highest, provided that the entry of the œsophagus does not allow the food to regurgitate, since the force of the stomach can easily protrude it towards the duodenum. This gut is mostly in the right side, and hangs pendulous in their abdomen, having its two extremities fixed to the liver. The ductus communis choledochus enters near its termination, where it mounts up again to be fixed to the liver; and left, by the contraction of the intestines, the bile should pass over without being intimately blended with the chyle, that duct enters downwards contrary to the course of the food, and contrary to what is observed in any of the animals we have mentioned yet. But still the general intention is kept in view, in allowing these juices the fairest chance of being intimately blended with the food.

109
Ductus
Chole-
docus.

110
Intestina
tenua.

The small guts are proportionally larger than those of carnivorous birds, for the general cause already assigned. At the end of the ilium they have two large intestina cæca, one on each side, which serve as reservoirs to the fæces; which after some remora there regurgitate into what soon becomes the rectum, which, together with the excretories of urine, and organs of generation, empties itself into the common cloaca. The small intestines are connected by a long loose mesentery, which has little or no fat accompanying the blood vessels, there being no hazard of the blood's being stopped. There are no lacteal vessels, glandule vagæ or pancreas affusilli to be observed here. The meseraic veins are proportionally very large, if you either compare them with the corresponding arteries, or consider them with respect to the guts themselves.

The want of lacteals, &c. is supplied by these veins. As a proof of these having a communication with the guts, in larger fowls the guts can be distended by blowing in at the meseraic vein; and from this difference of structure, the use of the glandule vagæ, &c. can easily be aligned, viz. the chyle in these animals, that have lacteals, being to be mixed with the blood in a considerable quantity at a time, lest its particles should attract one another too strongly, and so hinder this mixture; it was therefore necessary it should be well diluted by the humores iniqui, which bear a very great proportion to the quantity of pure chyle; since the lymph from the inferior extremities, abdominal viscera, neck, &c. are poured into it. Here there was no hazard of any such inconveniency by the chyle being mixed with the blood in small proportion from the immense number of the small extremities of the meseraic veins.

The pancreas in the creature lies betwixt the two folds of the duodenum, and sends two or three ducts into this gut pretty near the biliary.

The spleen is here of a round globular figure, situated between the liver and stomach, and betwixt these and the back-bone it enjoys the same properties as in other animals, viz. large blood-vessels, &c. All its blood is sent into the vena portarum, and has a perpetual coagulation. It has no excretory as far as we know. Their liver is divided into two equal lobes by a pellucid membrane, running according to the length of their body; and hence we may observe, that it is not proper to that bowel to lie on the right-side, which is still more confirmed by what we observe in fishes, where it almost lies in the left-side.

The shape of their gall-bladder is not much different from that of quadrupeds, but is thought to be longer in proportion to the size of the animal, and is farther removed from the liver; though in fishes it is still further removed, not being at all contiguous; and in them the ductus hepaticus and cysticus do not unite till just at the entry into the gut. In these animals, viz. fishes, there seems to be no way of the bile getting into the gall-bladder but by regurgitation.

The principal difference to be remarked in their heart, is the want of the valvule tricuspedes, and their place being supplied by one fleshy flap.

The lungs are not loose within the cavity of the thorax, but fixed to the bone all the way; neither are they divided into lobes, as in those animals that have a large motion in their spine. They are two red spongy bodies covered with a membrane that is pervious, and communicates with the large vessels or air bags that are dispersed over their whole abdomen, which vessels serve two very considerable uses; the one is to render their bodies specifically light, when they have a mind to ascend and buoy themselves up when flying, by distending their lungs with air, and also straiten their trachea arteria and so return the air.

Secondly, they supply the place of a muscular diaphragm and strong abdominal muscles; producing the same effects on the several contained viscera, as these muscles would have done without the inconveniency of their additional weight; and conducting as much to the exclusion of the egg and fæces.

The trachea arteria, near where it divides, is very much

much contracted, and their voice is principally owing to this coaction. If you listen attentively to a cock crowing, you will be sensible that the noise does not proceed from their throat, but deeper; nay this very pipe, when taken out of their body and cut off a little, after its division, and blown into, will make a squeaking noise, something like the voice of these creatures. On each side, a little higher than this contraction, there is a muscle arising from their sternum, which dilates the trachea. The cartilages of which the pipe is composed in this animal, go quite round it; whereas in men and quadrupeds, they are discontinued for about one-fourth on the back-part, and the intermediate space filled up by a membrane. Neither is the trachea so firmly attached to their vertebrae as in the other creatures we have examined. This structure we shall find of great service to them, if we consider, that had the same structure obtained in them as in us, their breath would have been in hazard of being stopped at every flexion or twisting of their neck, which they are frequently obliged to. This we may be sensible of by bending our necks considerably on one side, upon which we shall find a great straitness and difficulty of breathing; whereas their trachea is better fitted for following the flexions of the neck by its loose connection to the vertebrae: and as from the structure of the trachea it cannot yield to every cause distending the œsophagus as in us, it was proper they should be placed at a greater distance from each other, which we accordingly find they are.

In place of a muscular diaphragm, this creature has nothing but a thin membrane connected to the pericardium, which separates the thorax and abdomen. But besides this, the whole abdomen and thorax are divided by a longitudinal membrane or mediastinum connected to the lungs, pericardium, liver, stomach, and to the fat lying over their stomach and guts, which is analogous to an omentum, and supplies its place.

The kidneys lie in the hollow, excavated in the side of the back bone, from which there is sent out a blueish coloured canal, running along by the side of the vas deferens, and terminates directly into the common cloaca. This is the ureter, which opens by a peculiar aperture of its own, and not at the penis. This creature having no vesica urinaria, it was thought by some they never passed any urine, but that it went to the nourishment of the feathers, but this is false; for that whitish substance that you see their greenish feces covered with, and which turns afterwards chalky, is their urine. Let us next consider the organs of generation of both sexes, and first those of the male.

The testicles are situated one on each side of the back-bone, and are proportionally very large, to the creature's bulk. From these run out the vasa feminifera, at first freight, but after they recede farther from the body of the testicle, they acquire an undulated or convoluted form, as the epididymis in man. These convolutions partly supply the want of vesiculae feminales, their coition being at the same time very short; these terminate in the penis, of which this creature has two, one on each side of the common cloaca pointing directly outwards, and are very small and very short, hardly so big as a millet seed; whence they have escaped the notice of anatomists, who have

often denied their existence. This is what is chiefly remarkable in the organs of the male.

The racemus vitellorum being analogous to the ovary in the human subject, are attached by a proper membrane to the back-bone. This is very fine and thin, and continued down to the uterus. Its orifice is averse with respect to the ovary, yet notwithstanding, by the force of the orgasmus veneris, it turns round and grasps the vitellus, which, in its passage through this duct called the *infundibulum*, receives a thick gelatinous liquor, secreted by certain glands. This, with what it receives in the uterus, compose the white of the egg. By this tube then it is carried into the uterus.

The uterus is a large bag, placed at the end of the infundibulum, full of wrinkles on its inside; here the egg is completed, receiving its last involucre, and the shell is at last pushed out at an opening in the side of the common cloaca. From the testes in the male being so very large, in proportion to the body of the creature, there must necessarily be a great quantity of semen secreted; hence the animal is salacious, and becomes capable of impregnating so many females. The want of the vesiculae feminales is in some measure supplied by the convolutions of the vasa deferentia, and by the small distance betwixt the secreting and excretory organs. The two penes contribute also very much to their short coition, at which time the opening of the uterus into the cloaca is very much dilated, that the effect of the semen on the vitelli may be the greater.

A hen will of herself indeed lay eggs, but these are not impregnated, and yet appear entirely complete, except that the small black spot, which comes afterwards to be the rudiments of the chick, is not here to be observed. After having observed the contents of the abdomen and thorax, we next proceed to examine the parts about the neck and head.

These creatures, as was observed of fowls in general, have no teeth, which would have been needless, as they swallow their food entire; but their tongue is made pretty firm, lest it should be hurt by the sharp points of the grain they feed on. It is of a triangular figure and pointed before; and as by the depending posture, their meat is in hazard of falling out of their mouths, to prevent this, there are several small pointed papillae standing out upon their tongue and palate, with their points inclined backwards, allowing an easy passage to the food, but hindering its return.

We have here no vclum palatinum, uvula, or epiglottis, and in place of two large holes opening into the nose, there is only a long narrow rima supplied with pretty strong muscles, and such another supplies the place of a glottis. The creature has a power of shutting both at pleasure; and the nature of their food seems not only to exempt them from the hazard of its getting into the nose or trachea, but its sharp points would hurt an uvula or epiglottis, if they had any. Hence we see with what difficulty they swallow dough or other sort of food that can be easily moulded into any form.

Their cranium is more cellular and cavernous than ours, by this means their heads are light, yet strong enough to resist external injuries; for the enlarging

the diameter of bones contributes to their strength. By this cavernous cranium the organ of smelling is considerably enlarged; and further, finging birds, as is observed by Mr Ray and Mr Derham, have this cavernous structure of the brain still more observable; and we are told that the cavity of the tympanum communicates with the cells; but this seems rather founded on theory than matter of fact. Their brain is covered with the common membranes, but its external surface is not formed into so many gyre or convolutions as ours. Its anterior part is quite solid, of a cineritious colour, and so far has a resemblance of the corpora striata, as to give rise to the olfactory nerves. The whole of it appears to us as imperfect, and we can scarce determine whether there be any thing analogous to a third or fourth ventricle; neither the corpus callosum, fornix, nates, or testes, &c. can be observed here; which parts therefore cannot be imagined as absolutely necessary for the functions of life, since we find these creatures perform them sufficiently well. We may perhaps think these serve a particular use in man, who is a rational creature, but then quadrupeds enjoy them in common with man. These protuberances, &c. seem rather to depend on the different disposition of the several parts, being variously connected, and meeting in different directions in different places, than their being absolutely necessary for any particular use; and the uses that have been assigned to different parts of the brain by authors, seem to have no foundation but in the author's fancy.

129
The organ
of smell-
ing.

Their organ of smelling is very large and well provided with nerves; hence they have this sensation very acute. Ravens and other birds of prey give a sure proof of this by their being able to find out their prey though concealed from their sight, and at a considerable distance.

Those birds that grope for their food in the waters, mud, &c. have large nerves which run quite to the end of their bills, by which they find out and distinguish their food.

130
Eye.

The anterior part of their eyes (instead of having the sclerotic coat continued, so as to make near a sphere as in us) turns all of a sudden flat; so that here the sclerotic makes but half a sphere; and the cornea rises up afterwards, being a portion of a very small and distinct sphere; so that in these creatures there is a much greater difference betwixt the sclerotic and cornea than in us. Hence their eyes do not jut out of their heads as in man and quadrupeds. As most of these creatures are continually employed in hedges and thickets, therefore that their eyes might be secured from these injuries, as well as from too much light when fling in the face of the sun, there is a very elegant mechanism in their eyes, which is a membrane rising from the internal canthus of the eye, which at pleasure, like a curtain, can be made to cover the whole eye, and this by means of a proper muscle that rises from the sclerotic coat and passing round the optic nerves runs through the musculus oculi attollens (by which however the optic nerves are not compressed) and palpebra to be inserted into the edge of this membrane. Whenever this muscle ceases to act, the membrane by its own elasticity again discovers the eye. This covering is neither pellucid nor

opaque, both which would have been equally inconvenient, but being somewhat transparent, allows as many rays to enter as to make any object just visible, and is sufficient to direct them in their progression. By means of this membrane it is that the eagle is said to look at the sun. Quadrupeds, as we mentioned before, have a membrana nictitans; but then it only can cover that part of the eye which is never covered by their eye-lids.

131
Bourse
noire. Its
description
and uses.

Besides, all fowls have another particularity, whose use is not so well understood; and that is a pretty long black triangular purse rising from the bottom of their eye just at the entry of the optic nerve, and stretched out into their vitreous humour, and one would imagine it gave some threads to the crystalline. To this the French (who probably were the first who took notice of it in their dissections before the Royal Academy) give the name of *bourse noire*. This may possibly serve to fuscate some of the rays of light, that they may see objects more distinctly without hurting their eyes. It has a connection with the vitreous, and seems to be joined also to the crystalline humour. If we suppose it to have a power of contraction, (which may be as well allowed as that of the iris) it may so alter the position of the vitreous and crystalline humours, that the rays from any body may not fall perpendicularly upon the crystalline; and this seems to be necessary in them, since they cannot change the figure of the anterior part of their eye so much as we can do; and as this animal is exposed often to too great a number of rays of light, so they having no tapetum, have the bottom of their eye wholly black on the retina; and in consequence of this fowls see very ill in the dark.

132
Organ of
hearing.

They have no external ear, but in place thereof a tuft of very fine feathers covering the meatus auditorius, which easily allow the rays of sound to pass them, and likewise prevent dust, or any insect from getting in. An external ear would have been inconvenient in their passing through thickets and in flying, &c. A liquor is separated in the external part of the ear or meatus auditorius to lubricate the passage, and further prevent the entrance of any insects, &c. The membrana tympani is convex externally, and no muscles are fixed to the bones of their ear, which are rather of a cartilaginous consistence; any tremulous motions impressed on the air are communicated in these creatures, merely by the spring and elasticity of these bones; so probably the membrane is not so distended as in the human ear, where this is done by muscles. The cochlea and semicircular canals are very distinct and easily prepared.

CHAP. VI. The Anatomy of a carnivorous Fowl.

We come next to the birds of prey, and for an example shall take a stentil. The principal difference to be observed in them, is in their chylipoietic viscera, which may be accounted for from their different way of life.

133

Immediately under their clavicles, you will observe the œsophagus expanded into their ingluviæ, which is proportionally less than in the granivorous kind, since their food does not swell so much by maceration, and for the same reason there is a less quantity of a menstruum to be found here.

134
Ingluviæ.

135 The ventriculus succenturiatus plentifully stored with glands, situated immediately above their stomach, which we see here is evidently membranous, otherwise than in the granivorous kind; and this difference, which is almost the only one we shall find betwixt the two different species of fowls, is easily accounted for from the nature of their food, which requires less attrition, being easier of digestion than that of the other kind; nevertheless it seems requisite it should be stronger than the human, to compensate the want of abdominal muscles, which are here very thin.

136 The same mechanism obtains in this creature's duodenum, that we have hitherto observed. As being a carnivorous animal, its guts are proportionally shorter than those of the granivorous kind, for the reason first given, viz. its food being more liable to corrupt, therefore not proper to be long detained in the body, and for that reason it has no intestine caeca, of which the other species of fowls have a pair. The difference in their wings, backs, and claws are obvious, and have been already in some measure observed.

CHAP. VII. The Anatomy of Fishes.

137 AQUEOUS animals are generally divided into such as have lungs, and such as want them. The first species differ very inconsiderably from an ox or any other quadruped, and are not easily procured; so that all we have to say on fishes, shall be taken from that species, which is not provided with respiratory organs.

138 Of these we may first observe, that they have a very strong thick cuticle composed evidently of a great number of scales laid one on another like the tiles of houses; this among other arguments serves to prove the human epidermis to be of a squamous structure.

139 In the next place these creatures have neither anterior nor posterior extremities, as quadrupeds and fowls: for their progression is performed in a different way from either of these species of animals; for this purpose they are provided with machines properly consisting of a great number of elastic beams, connected to one another by firm membranes, and with a tail of the same texture; their spine is very moveable towards the posterior part, and the strongest muscles of their bodies are inserted there. Their tails are so framed as to contract to a narrow space when drawn together to either side, and to expand again when drawn to a straight line with their bodies, so by the assistance of this broad tail, and the fins on their sides, they make their progression much in the same way as a boat with oars on its sides and rudder at its stern. The perpendicular fins situated on the superior part of their body keep them in equilibrium, hindering the belly from turning uppermost, which it would readily do, because of the air bag in the abdomen rendering their belly specifically lighter than their back, but by the resistance these fins meet with when inclined to either side, they are kept with their backs always uppermost. The best account of this matter we have in the treatise before mentioned, viz. *Be-relle de motu Animalium*, Part I. chap. 23.

It may be next observed, that these creatures have nothing that can be called a neck, seeing they seek their food in an horizontal way, and can move their bo-

140 dies either upwards or downwards as they have occasion by the contraction or dilatation of their air bag; a long neck, as it would hinder their progression, would be very disadvantageous in the element they live in.

The abdomen is covered on the inferior part with a black-coloured thin membrane resembling our peritoneum. It is divided from the thorax by a thin membranous partition, which has no muscular appearance; so that we have now seen two different sorts of animals that have no muscular diaphragm.

141 These creatures are not provided with teeth proper for breaking their aliment into smaller morsels; as the food they use is generally small fishes or other animals that need no trituration in the mouth, but spontaneously corrupt, and gradually dissolve into a liquid chyle. Their teeth serve to grasp their prey and hinder the creatures they have once caught from escaping again. For the same purpose the internal cartilaginous basis of the bronchi, and the two round bodies situated in the posterior part of the jaws, have a great number of tender-hooks fixed into them in such a manner, as that any thing can easily get down, but is hindered to get backwards. The water that is necessarily taken in along with their food in too great quantities to be received into their jaws in deglutition, passes betwixt the interstices of the bronchi, and the flap that covers them. The compression of the water on the bronchi is of considerable use to the creature, as we shall explain by and by.

142 The oesophagus in these creatures is very short, and scarcely distinguished from their stomach, seeing their food lies almost equally in both. The stomach is of an oblong figure. There are commonly found small fishes in the stomach of large ones, still retaining their natural form, but when touched they melt down into a jelly. From this and the great quantity of liquors poured into their stomachs, we may conclude that digestion is solely brought about in them, by the dissolving power of a menstruum, and that no trituration happens here.

143 The guts in these animals are very short, making only three turns, the last of which ends in the common cloaca for the feces, urine and semen, situated about the middle of the inferior part of their bodies.

144 What we call the *pancreas*, is by some named the *intestinula caeca*. It consists of a very great number of small threads, like so many little worms, which all terminate at last in two larger canals, that open into the first gut, and pour into it a viscous liquor, much about the place where the biliary ducts enter. Their intestines are connected to the back-bone by a membrane analogous to a mesentery. No lacteals have been yet observed, and it is probable, their aliment is taken in by the meseraic veins.

145 Their liver is very large, of a whitish colour, and lies almost in the left-side wholly, and contains a great deal of fat.

146 The gall-bladder is situated a considerable way from the liver, and sends out a canal, the cystic duct, which joins with the hepatic duct just at the entry into the gut; some fibres are stretched from the liver to the gall-bladder, but none have hitherto discovered any cavity in these cords; so that in this animal it

140 Teeth, for what made.

141 Digestion performed solely by a menstruum.

143 Intestina.

143 Pancreas.

144 Liver, gall-bladder, and their ducts.

should seem impossible that the bile can be carried into the gall-bladder in the ordinary way, and consequently must either be secreted on the sides of that sac, or regurgitate into it from the canalis choledochus.

145
Spleen, its
use drawn
from ana-
logy.

The spleen is placed near the back-bone, and at a place where it is subjected to an alternate pressure from the constriction and dilatation of the air-bag, which is situated in the neighbourhood. Since in all animals, we find the spleen attached to somewhat that may give it a concussion, as in the human subject and quadrupeds, it is contiguous to the diaphragm; in fowls it is placed betwixt the back-bone, the liver and stomach; in fishes it lies on the sacculus ærius; and since we find it so well served with blood-vessels, and all its blood returning into the liver, we must not conclude the spleen to be an inutile pondus, only to serve as a balance to the animal pro equilibrio, but particularly designed for preparing the blood to the liver.

146
Organs of
generation.

The only organs of generation in this animal are two menstruous bags situated in the abdomen uniting near the podex. These in the male are filled with a whitish firm substance called the *milt*, and in the female with an infinite number of little ova clustered together, of a reddish yellow colour called the *roe*. Both these at spawning time we find very much distended; whereas, at another time, the male organs can scarce be distinguished from the female, nor is there any proper instrument in the male for throwing the seed into the organs of the female, as in other creatures. We shall not take upon us to determine the way whereby the female sperm is impregnated; but we find, that the spawn of frogs consists in the small specks wrapt up in a whitish glutinous liquor; these specks are the rudiments of the young frogs, which are nourished in that liquor, till they are able to go in search of their food. In the same way the ova of fishes are thrown out and deposited in the sand, the male being for the most part ready to impregnate them, and they are incubated by the heat of the sun. It is curious enough to remark with what care they seek for a proper place to deposit their ova, by swimming to the shallow, where they can better enjoy the sun's rays, and shun the large jaws of other fishes. The river fishes again spawn in some creek, free from the hazard of the impetuous stream. But whether this mixture be brought about in fishes, by a simple application of the genitals to each other; or if both of them throw out their liquors at the same time in one place, and thus bring about the desired mixture, is not easy to determine; the latter seems most probable. These creatures are so shy that we cannot possibly get to observe their way of copulation, and are consequently but little acquainted with their natural history.

147
The air-
bladder,
and its
uses.

After raising up the black peritoneum, there comes in view an oblong white membranous bag, in which there is nothing contained but air. This is the swimming-bladder; it lies close to the back-bone, and has a pretty strong muscular coat, whereby it can contract itself. By contracting this bag, they can make the muscles specifically heavier than water and so readily fall to the bottom; whereas the muscular fibres ceasing to act, they become specifically lighter than water and so swim above. According to the different

degrees of contraction and dilatation of this bladder, they can keep higher or lower in the water at pleasure. Hence flounders, soles, raia, and such other fishes as want this sac, are found always groveling at the bottom of the water: it is owing to this that dead fishes (unless this membrane has been previously broke) are found swimming a-top, the muscular fibres then ceasing to act, and that with their bellies uppermost; for the back-bone cannot yield, and the distended sac is protruded into the abdomen, and the back is consequently heaviest at its upper part according to their posture. There is here placed a glandular substance containing a good quantity of red blood, and all the red in their body is contiguous to this air bag, excepting the guts. From the anterior part of the bag, go out two processes or appendices, which, according to the gentlemen of the French academy, terminate in their fauces; but there is great reason to suspect that their experiments were inaccurately made; and that there is here, as in some places of the human body, an aer insus.

At the superior part of this bag there are other red coloured bodies, of a glandular nature, which are connected with the kidneys. From them the ureters go down to their insertion in the vesica urinaria, which lies in the lower part of the abdomen, and the urethra is there produced, which terminates in the podex.

These last mentioned parts have not hitherto been observed in some species of fishes, whence authors too hastily denied them in all. These creatures have a membranous diaphragm which forms a sac, in which the heart is contained. It is very tense, and almost perpendicular to the vertebre.

The heart is of a triangular form with its base downwards, and its apex uppermost, which situation it has because of the branchie. It has but one auricle and one ventricle, because they want lungs; and one great artery. The size of the auricle and ventricle are much the same; the artery sends out numberless branches to the branchie or gills.

The branchie lie in two large slits at each side of their heads, and seem to be all they have that bears any analogy to lungs. Their form is semi-circular; they have a vast number of red fibrille standing out on each side of them like a fringe, and very much resemble the vane of a feather. These branchie are perpetually subjected to an alternate motion and pressure from the water; and we may here remark, that we have not found any red blood, but in places subjected to this alternate pressure; this observation will help us in explaining the action of the lungs upon the blood. Over these gills there is a large flap, allowing a communication externally, by which the water they are obliged to take into their mouths with their food finds an exit, without passing into their stomach; it is owing to these flaps coming so far down, that the heart is said commonly to be situated in their heads.

Their brains are formed pretty much in the same way as that of fowls, only we may observe that the posterior lobes bear a greater proportion to the anterior.

Their organ of smelling is large, and they have a power of contracting and dilating the entry into their nose

nose as they have occasion. It seems to be mostly by their acute smell that they discover their food; for their tongue seems not to have been designed for a very nice sensation, being of a pretty firm cartilaginous substance; and common experiment evinces, that their sight is not of so much use to them as their smell in searching for their nourishment. If you throw a fresh worm into the water, a fish shall distinguish it at a considerable distance; and that this is not done by the eye, is plain from observing, that after the same worm has been a considerable time in the water and lost its smell, no fishes will come near it: but if you take out the bait and make several little incisions into it, so as to let out more of the odoriferous effluvia, it shall have the same effect as formerly. Now it is certain, had the creatures discovered this bait with their eyes, they would have come equally to it in both cases: in consequence of their smell being the principal means they have of discovering their food, we may frequently observe their allowing themselves to be carried down with the stream, that they may ascend again leisurely against the current of the water; thus the odorous particles swimming in that medium, being applied more forcibly to their smelling organs, produce a stronger sensation.

155
Optic
nerves.

The optic nerves in these animals are not confounded with one another in their middle progress betwixt their origin and the orbit, but the one passes over the other without any communication; so that the nerve that comes from the left side of the brain goes distinctly to the right eye: and *vice versa*.

156
The crystalline hum-
our a
compleat
sphere, and
why.

The lens crystallina is here a compleat sphere; whereas in men and all other terrestrial animals it consists of two portions of unequal spheres laid on one another: to account for this, it must be considered that these creatures have got no aqueous humour, as the rays that come to their eyes are conveyed through a medium of the same density with that humour in other animals, and consequently would have gone on

in a straight line without any refraction till they came to the lens, although they had been provided with an aqueous humour; thus then the rays impinging upon their lens have hitherto suffered no refraction; that they might therefore be sufficiently refracted and meet in a point on the retina, it was necessary the lens should be made more convex than it is in other creatures who have the rays considerably refracted in their passage from the air through the aqueous humour.

As fishes are continually exposed to injuries in the uncertain element they live in, and as they are in perpetual danger of becoming a prey to the larger ones, it was necessary their eyes should never be shut, and in consequence of this they are not provided with palpebræ; but then, as in the current itself, the eye must be exposed to several injuries, there was a necessity it should be sufficiently defended, which in effect it is by a firm pellucid membrane that seems to be a continuation of the cuticula, being stretched over here. The epidermis is very proper for this purpose, as being insensible and destitute of vessels, and consequently not liable to obstructions, or by that means of becoming opaque.

157
Fishes, if
they hear
or not.

Whether fishes have a sense of hearing or not is very uncertain: all that has the appearance of an organ of hearing in these creatures is a bone, about the bulk of one half of a common bean, of a particular structure, being very brittle and composed of a great many different segments laid at one another's sides, and situated in a particular form at the side of the brain; is then the idea of sound communicated to them by means of this bone? or does their running away, at stamping hard on the ground or crying loud, depend upon some other kind of sensation? This may possibly be produced in them, by a tremulous motion communicated to their bodies by the circumambient water, which is put in agitation, from the like concussions happening in the air or neighbouring ground.

C O M

COMPARATIVE Degree, among grammarians, that between the positive and superlative degrees, expressing any particular quality above or beneath the level of another.

COMPARISON, in a general sense, the consideration of the relation between two persons or things, when opposed and set against each other, by which we judge of their agreement or difference.

COMPARISON of Ideas, an act of the mind, whereby it compares its ideas one with another, in respect of extent, degree, time, place, or any other circumstances. See IDEA.

Brutes seem not to have this faculty in any great degree: they have, probably, several ideas distinct enough; but cannot compare them farther than as to some sensible circumstances annexed to the objects themselves; the power of comparing general ideas, which we observe in men, we may probably conjecture they have not at all.

COMPARISON, in grammar, the inflection of the comparative degree. See GRAMMAR, n° 54.

COMPARISON, in rhetoric, is a figure whereby two

C O M

things are considered with regard to some third, which is common to them both.

Instruction is the principal, but not the only end of comparison. It may be employed with success in putting a subject in a strong point of view. A lively idea is formed of a man's courage by likening it to that of a lion; and eloquence is exalted in our imagination comparing it to a river overflowing its bank, and involving all in its impetuous course. The same effect is produced by contrast: a man in prosperity becomes more sensible of his happiness, by comparing his condition with that of a person in want of bread. Thus comparison is subservient to poetry as well as to philosophy.

Comparisons serve two purposes: when addressed to the understanding, their purpose is to instruct: when to the heart, their purpose is to please. Various means contribute to the latter: 1st, the suggesting some unusual resemblance or contrast; 2^d, the setting an object in the strongest light; 3^d, the associating an object with others that are agreeable; 4th, the elevating an object; and 5th, the depressing it. And that com-

RESEM-
BLANCE
and Diff-
parisons mislead.

Comparison parisons may give pleasure by these various means, will be made evident by examples which shall be given, after premising some general observations.

Objects of different senses cannot be compared together; for such objects are totally separated from each other, and have no circumstance in common to admit either resemblance or contrast. Objects of hearing may be compared together, as also of taste, of smell, and of touch: but the chief fund of comparison are objects of sight; because, in writing or speaking, things can only be compared in idea, and the ideas of sight are more distinct and lively than those of any other sense.

When a nation emerging out of barbarity begins to think of the fine arts, the beauties of language cannot long lie concealed; and when discovered, they are generally, by the force of novelty, carried beyond all bounds of moderation. Thus, in the earliest poems of every nation, we find metaphors and similes founded on the slightest and most distant resemblances, which, losing their grace with their novelty, wear gradually out of repute; and now, by the improvement of taste, no metaphor nor simile is admitted into any polite composition but of the most striking kind. To illustrate this observation, a specimen shall be given afterward of such metaphors as we have been describing: with respect to similes take the following specimen.

"Behold, thou art fair, my love: thy hair is as
"a flock of goats that appear from Mount Gilead:
"thy teeth are like a flock of sheep from the wash-
"ing, every one bearing twins: thy lips are like
"a thread of scarlet: thy neck like the tower of
"David built for an armoury, whereon hang a
"thousand shields of mighty men: thy two breasts
"like two young roes that are twins, which feed
"among the lilies: thy eyes like the fish-pools in
"Hesbon, by the gate of Bath-rabbim: thy nose
"like the tower of Lebanon, looking toward Da-
"mascus." *Song of Solomon.*
"Thou art like snow on the heath; thy hair
"like the mist of Cromla, when it curls on the
"rocks and shines to the beam of the west: thy
"breasts are like two smooth rocks seen from
"Branno of the streams: thy arms like two white
"pillars in the hall of the mighty Fingal."

Fingal.

It has no good effect to compare things by way of simile that are of the same kind; nor to contrast things of different kinds. The reason is given in the article above cited on the margin, and shall be here illustrated by examples. The first is a comparison built upon a resemblance so obvious as to make little or no impression. Speaking of the fallen angels searching for mines of gold:

A numerous brigade hasten'd: as when bands
Of pioneers with spade and pick-ax arm'd,
Forerun the royal camp to trench a field
Or cast a rampart.

Milton.

The next is of things contrasted that are of different kinds.

Queen. What, is my Richard both in shape and mind

Transform'd and weak? Hath Bolingbroke depos'd

Thine intellect? Hath he been in thy heart?

The lion, dying, thrusteth forth his paw,
And wounds the earth, if nothing else, with rage
To be o'erpower'd: and wilt thou, pupil like,
Take thy correction mildly, kiss the rod,
And fawn on rage with base humility?

Richard II. act 5. sc. 1.

This comparison has scarce any force: a man and a lion are of different species, and therefore are proper subjects for a simile; but there is no such resemblance between them in general, as to produce any strong effect by contrasting particular attributes or circumstances.

A third general observation is, That abstract terms can never be the subject of comparison, otherwise than by being personified. Shakspeare compares adversity to a road, and slander to the bite of a crocodile; but in such comparisons these abstract terms must be imagined sensible beings.

To have a just notion of comparisons, they must be distinguished into two kinds; one common and familiar, as where a man is compared to a lion in courage, or to a horse in speed; the other more distant and refined, where two things that have in themselves no resemblance or opposition, are compared with respect to their effects. There is no resemblance between a flower-plot and a cheerful song; and yet they may be compared with respect to their effects, the emotions they produce in the mind being extremely similar. There is as little resemblance between fraternal concord and precious ointment; and yet observe how successfully they are compared with respect to the impressions they make.

"Behold, how good and how pleasant it is for
"brethren to dwell together in unity. It is like
"the precious ointment upon the head, that ran
"down upon Aaron's beard, and descended to the
"skirts of his garment." *Psalms 133.*

For illustrating this sort of comparison, we shall add some more examples:

"Delightful is thy presence, O Fingal! it is like
"the sun on Cromla, when the hunter mourns his
"absence for a season, and sees him between the
"clouds.
"Did not Ossian hear a voice; or is it the sound
"of days that are no more? Often, like the even-
"ing-fun, comes the memory of former times on
"my soul.

"His countenance is settled from war; and is
"as calm as the evening-beam, that from the cloud
"of the west looks on Cona's silent vale."

Fingal.

We now proceed to illustrate, by particular instances, the different means by which comparisons, whether of the one sort or the other, can afford pleasure; and, in the order above established, we shall begin with such instances as are agreeable, by suggesting some unusual resemblance or contrast.

Sweet are the uses of Adversity,
Which, like the toad, ugly and venomous,
Wears yet a precious jewel in her head.

As you like it, act 2. sc. 1.

See, how the Morning opes her golden gates,
And takes her farewell of the glorious sun;

How

How well resembles it the prime of youth,
Trim'd like a yonker prancing to his love.

Second Part Henry VI. act 2. sc. 1.

Thus they their doubtful consultations dark
Ended, rejoicing in their matchless chief:
As when from mountain tops, the dusky clouds
Ascending, while the North-wind sleeps, o'erspread
Heav'n's cheerful face, the lowering element
Scowls o'er the darken'd landscape, snow, and
shower;

If chance the radiant sun with farewell sweet
Extends his ev'ning-beam, the fields revive,
The birds their notes renew, and bleating herds
Attest their joy, that hill and valley rings.

Paradise Lost, book 2.

None of the foregoing similes tend to illustrate the principal subject: and therefore the chief pleasure they afford must arise from suggesting resemblances that are not obvious: for undoubtedly a beautiful subject introduced to form the simile affords a separate pleasure, which is felt in the similes mentioned, particularly in that cited from Milton.

The next effect of a comparison in the order mentioned, is to place an object in a strong point of view; which effect is remarkable in the following similes.

As when two scales are charg'd with doubtful loads,
From side to side the trembling balance nods,
(While some laborious matron, just and poor,
With nice exactness weighs her woolly folds),
Till pois'd aloft, the resting beam suspends
Each equal weight; nor this nor that descends:
So stood the war, till Hector's matchless might,
With fates prevailing, turn'd the scale of fight.
Pierce as a whirlwind up the wall he flies,
And fires his host with loud repeated cries.

Iliad, b. xii. 521.

—She never told her love;
But let concealment, like a worm i' th' bud,
Feed on her damask cheek: she pin'd in thought;
And with a green and yellow melancholy,
She sat like patience on a monument,
Smiling at grief.

Twelfth Night, act 2. sc. 6.

"There is a joy in grief when peace dwells with
the sorrowful. But they are wasted with mourn-
ing, O daughter of Toscar, and their days are
few. They fall away like the flower on which
the sun looks in his strength, after the mid dew
has passed over it, and its head is heavy with the
drops of night."

Fingal.

—Out, out, brief candle!
Life's but a walking shadow, a poor player,
That thruts and frets his hour upon the stage,
And then is heard no more.

Macbeth, act 5. sc. 5.

O thou goddess,
Thou divine nature! how thyself thou blazon'it
In these two princely boys! they are as gentle
As zephyrs blowing below the violet,
Not wagging his sweet head; and yet as rough
(Their royal blood inchas'd) as the rud'ft wind,
That by the top doth take the mountain-pine,
And make him stoop to th' vale.

Cymbeline, act 4. sc. 4.

"Why did not I pass away in secret, like the
flower of the rock that lifts its fair head unseen,
and throws its withered leaves on the blast?"

Fingal.

As words convey but a faint and obscure notion of great numbers, a poet, to give a lively notion of the object he describes with regard to number, does well to compare it to what is familiar and commonly known. Thus Homer compares the Grecian army in point of number to a swarm of bees: in another passage he compares it to that profusion of leaves and flowers which appear in the spring, or of insects in a summer's evening: And Milton,

—As when the potent rod
Of Amram's son in Egypt's evil day
Wav'd round the coast, up call'd a pithy cloud
Of locusts, warping on the eastern wind,
That o'er the realm of impious Pharaoh hung
Like night, and darken'd all the land of Nile:
So numberless were those bad angels seen,
Hov'ring on wing under the cope of hell,
'Twixt upper, nether, and surrounding fires.

Paradise Lost, book 1.

Such comparisons have, by some writers, been condemned for the lowliness of the images introduced: but surely without reason; for, with regard to numbers, they put the principal subject in a strong light.

The foregoing comparisons operate by resemblance; others have the same effect by contrast.

York. I am the last of noble Edward's sons,
Of whom thy father, prince of Wales, was first;
In war, was never lion rag'd more fierce;
In peace, was never gentle lamb more mild;
Than was that young and princely gentleman.
His face thou hast, for even so look'd he,
Accomplish'd with the number of thy hours.
But when he frown'd, it was against the French,
And not against his friends. His noble hand
Did win what he did spend; and spent not that
Which his triumphant father's hand had won.
His hands were guilty of no kindred's blood,
But bloody with the enemies of his kin.
Oh Richard, York is too far gone with grief,
Or else he never would compare between.

Richard II. act 2. sc. 3.

Milton has a peculiar talent in embellishing the principal subject, by associating it with others that are agreeable; which is the third end of a comparison. Similes of this kind have, beside, a separate effect: they diversify the narration by new images that are not strictly necessary to the comparison: they are short episodes, which, without drawing us from the principal subject, afford great delight by their beauty and variety.

He scarce had ceas'd, when the superior fiend
Was moving toward the shore; his pond'rous shield,
Ethereal temper, maffy, large, and round,
Behind him cast; the broad circumference
Hung on his shoulders like the moon, whose orb
Through optic glass the Tuscan artist views
At ev'ning from the top of F'cole,
Or in Valdarno, to descry new lands,
Rivers, or mountains, in her spotty globe.

Milton, book 1.

—Thus

Thus far these beyond
Compare of mortal powers, yet observ'd
Their dread commander. He, above the rest,
In shape and stature proudly eminent,
Stood like a tow'r; his form had not yet lost
All her original brightness, nor appear'd
Less than archangel ruin'd, and th' excess
Of glory obscur'd: as when the sun new-risen
Looks through the horizontal misty air
Shorn of his beams; or, from behind the moon
In dim eclipse, disastrous twilight sheds
On half the nations, and with fear of change
Perplexes monarchs.

Milton, book 1.

As when a vulture on Imaus bred,
Whose snowy ridge the roving Tartar bounds,
Dislodging from a region scarce of prey
To gorge the flesh of lambs, or yearning kids,
On hills where flocks are fed, flies toward the springs
Of Ganges or Hydaspes, Indian streams,
But in his way lights on the barren plains
Of Sericana, where Chinese drive
With sails and wind their cany waggons light:
So on this windy sea of land, the fiend
Walk'd up and down alone, bent on his prey

Milton, book 3.

Next of comparisons that aggrandise or elevate.
These affect us more than any other sort: the reason
of this will be evident from the following instances.

As when a flame the winding valley fills,
And runs on crackling shrubs between the hills,
Then o'er the stubble up the mountain flies,
Flies the high woods, and blazes to the skies,
This way and that, the spreading torrent roars;
So sweeps the hero through the wasted shores.
Around him wide, immense destruction pours,
And earth is delug'd with the sanguine show'rs.

Iliad xx. 569.

Methinks, king Richard and myself should meet
With no less terror than the elements
Of fire and water, when their thundering shock,
At meeting tears the cloudy cheeks of heaven.

Richard II. act 3. sc. 5.

"As rusheth a foamy stream from the dark shady
"steep of Cromla, when thunder is rolling above,
"and dark brown night rests on the hill: so fierce,
"so vast, so terrible, rush forward the sons of Erin.
"The chief, like a whale of ocean followed by all
"its billows, pours valour forth as a stream, rolling
"its might along the shore."

Fingal, book 1.

"As roll a thousand waves to a rock, so Swa-
"ran's host came on; as meets a rock a thousand
"waves, so Inisfail met Swaran."

Ibid.

The last article mentioned, is that of lessening or
depressing a hated or disagreeable object; which is
effectually done by resembling it to any thing low or
despicable.

Thus Milton, in his description of the rout of the
rebel-angels, happily expresses their terror and dismay
in the following simile:

As a herd
Of goats or timorous flock together throng'd
Drove them before him thunder-struck, pursu'd

With terrors and with furies to the bounds
And crystal wall of heav'n, which op'ning wide,
Roll'd inward, and a spacious gap disclos'd
Into the wasteful deep; the monstrous fight
Struck them with horror backward, but far worse
Urg'd them behind; headlong themselves they threw
Down from the verge of heav'n

Milton, book 6.

By this time the different purposes of comparison,
and the various impressions it makes on the mind, are
sufficiently illustrated by proper examples. This was
an easy work. It is more difficult to lay down rules
about the propriety or impropriety of comparisons;
in what circumstances they may be introduced, and in
what circumstances they are out of place. It is evi-
dent that a comparison is not proper upon every oc-
casion: a man in his cool and sedate moments, is not
disposed to poetical flights, nor to sacrifice truth and
reality to the delusive operations of the imagination;
far less is he so disposed, when oppressed with care,
or interested in some important transaction that occu-
pies him totally. On the other hand, it is observable,
that a man, when elevated or animated by any pas-
sion, is disposed to elevate or animate all his subjects:
he avoids familiar names, exalts objects by circumlo-
cution and metaphor, and gives even life and volun-
tary action to inanimate beings. In this warmth of
mind, the highest poetical flights are indulged, and
the boldest similes and metaphors relished. But with-
out soaring so high, the mind is frequently in a tone
to relish chaste and moderate ornament; such as com-
parisons that set the principal object in a strong point
of view, or that embellish and diversify the narration.
In general, when by any animating passion, whether
pleasant or painful, an impulse is given to the imagi-
nation; we are in that condition disposed to every
sort of figurative expression, and in particular to com-
parisons. This in a great measure is evident from
the comparisons already mentioned; and shall be fur-
ther illustrated by other instances. Love, for example,
in its infancy, rousing the imagination, prompts the
heart to display itself in figurative language, and in
similes:

Troilus. Tell me, Apollo, for thy Daphne's love,
What Cressid is, what Pandar, and what we?
Her bed is India, there she lies, a pearl:
Between our Ilium, and where she resides,
Let it be call'd the wild and wandering flood;
Ourself the merchant, and this sailing Pandar
Our doubtful hope, our convoy, and our bark.

Troilus and Cressida, act 1. sc. 1.

Again:

Come, gentle night; come, loving black-brow'd
night!

Give me my Romeo; and, when he shall die,
Take him, and cut him out in little stars,
And he will make the face of heav'n so fine,
That all the world shall be in love with night,
And pay no worship to the garish sun.

Romeo and Juliet, act 3. sc. 4.

But it will be a better illustration of the present
head, to give examples where comparisons are im-
properly introduced. Similes are not the language of a
man in his ordinary state of mind, dispatching his
daily

Comparison daily and usual work : for that reason, the following speech of a gardener to his servant, is extremely improper :

Go bind thou up yon dangling apricots,
Which, like unruly children, make their fire
Stoop with oppression of their prodigal weight :
Give some supportance to the bending twigs.
Go thou, and, like an executioner,
Cut off the heads of too-fast-growing sprays,
That look too lofty in our commonwealth :
All must be even in our government.

Richard II. act 3. sc. 7.

The fertility of Shakespear's vein betrays him frequently into this error.

Rooted grief, deep anguish, terror, remorse, despair, and all the severe dispiriting passions, are declared enemies, perhaps not to figurative language in general, but undoubtedly to the pomp and solemnity of comparison. Upon this account, the simile pronounced by young Rutland, under terror of death from an inveterate enemy, and praying mercy, is unnatural :

So looks the pent-up lion o'er the wretch
That trembles under his devouring paws ;
And so he walks insulting o'er his prey,
And so he comes to rend his limbs asunder.
Ah, gentle Clifford, kill me with thy sword,
And not with such a cruel threat'ning look.

Third part Henry VI. act 1. sc. 5.

A man spent and dispirited after losing a battle, is not disposed to heighten or illustrate his discourse by similes.

York. With this we charg'd again ; but out ! alas,
We bodg'd again ; as I have seen a swan
With bootless labour swim against the tide,
And spend her strength with over-matching waves.
Ah ! hark, the fatal followers do pursue ;
And I am faint and cannot fly their fury.
The sands are number'd that make up my life ;
Here must I stay, and here my life must end.

Third part Henry VI. act 1. sc. 6.

Similes thus unseasonably introduced are finely ridiculed in the "Rehearsal."

"*Bayes.* Now here she must make a simile.

"*Smith.* Where's the necessity of that, Mr Bayes?

"*Bayes.* Because she's surprized ; that's a general rule ; you must ever make a simile when you are surprized ; 'tis a new way of writing."

A comparison is not always faultless, even where it is properly introduced. A comparison, like other human productions, may fall short of its end ; of which defect instances are not rare even among good writers : and to complete the present subject, it will be necessary to make some observations upon such faulty comparisons. Nothing can be more erroneous than to institute a comparison too faint : a distant resemblance or contrast fatigues the mind with its obscurity, instead of amusing it ; and tends not to fulfil any one end of a comparison. The following similes seem to labour under this defect.

K. Rich. Give me the crown.—Here, cousin, seize the crown,

Here, on this side, my hand ; on that side, thine.
Now is this golden crown like a deep well,
That owes two buckets, filling one another ;
Vol. III.

The emptier ever dancing in the air,
The other down, unseen and full of water ;
That bucket down, and full of tears, am I,
Drinking my griefs, whilst you mount up on high.

Richard II. act 4. sc. 3.

K. John. Oh ! cousin, thou art come to set mine eye ;

The tackle of my heart is crack'd and burnt ;
And all the shrouds wherewith my life should fail,
Are turned to one thread, one little hair :
My heart hath one poor string to stay it by,
Which holds but till thy news be uttered.

King John, act 5. sc. 10.

York. My uncles both are slain in rescuing me :
And all my followers to the eager foe
Turn back, and fly like ships before the wind,
Or lambs pursued by hunger-starved wolves.

Third part Henry VI. act 1. sc. 6.

The latter of the two similes is good : the former, because of the faintness of the resemblance, produces no good effect, and crowds the narration with an useless image.

In an epic poem, or in any elevated subject, a writer ought to avoid raising a simile upon a low image, which never fails to bring down the principal subject. In general, it is a rule, that a grand object ought never to be resembled to one that is diminutive, however delicate the resemblance may be : for it is the peculiar character of a grand object to fix the attention, and swell the mind ; in which state, it is disagreeable to contract the mind to a minute object, however elegant. The resembling an object to one that is greater, has, on the contrary, a good effect, by raising or swelling the mind : for one passes with satisfaction from a small to a great object ; but cannot be drawn down, without reluctance, from great to small. Hence the following similes are faulty.

Meanwhile the troops beneath Patroclus' care,
Invade the Trojans, and commence the war.
As wasps, provok'd by children in their play,
Pour from their mansions by the broad highway,
In swarms the guiltless traveller engage,
Whet all their stings, and call forth all their rage ;
All rise in arms, and with a general cry
Assert their waxen domes and buzzing progeny :
Thus from the tents the fervent legion swarms,
So loud their clamours, and so keen their arms.

Iliad xvi. 312.

So burns the vengeful hornet (foul all o'er)
Repuls'd in vain, and thirty still of gore ;
(Bold son of air and heat) on angry wings
Untam'd, untir'd, he turns, attacks, and stings.
Fir'd with like ardour, fierce Atreides flew,
And sent his soul with ev'ry lance he threw.

Iliad, xvii. 642.

An error opposite to the former, is the introducing a resembling image, so elevated or great as to bear no proportion to the principal subject. Their remarkable disparity, being the most striking circumstance, seizes the mind, and never fails to depress the principal subject by contrast, instead of raising it by resemblance : and if the disparity be exceeding great, the simile takes on an air of burlesque ; nothing being more ridiculous than to force an object out of its pro-

Comparison per rank in nature, by equalling it with one greatly superior or greatly inferior. This will be evident from the following comparison.

Loud as a bull makes hill and valley ring,
So roar'd the lock when it releas'd the spring.

Odyssey, xxi. 51.

Such a simile upon the simplest of all actions, that of opening a lock, is pure burlesque.

A writer of delicacy will avoid drawing his comparisons from any image that is nauseous, ugly, or remarkably disagreeable; for however strong the resemblance may be, more will be lost than gained by such comparison. Therefore we cannot help condemning, though with some reluctance, the following simile, or rather metaphor.

O thou fond many! with what loud applause
Didst thou beat heav'n with blessing Bolingbroke
Before he was what thou would'st have him be?
And now being trimm'd up in thine own desires,
Thou, beastly feeder, art so full of him,
That thou provok'st thyself to cast him up.
And so, thou common dog, didst thou disgorge
Thy glutton bosom of the royal Richard,
And now thou would'st eat thy dead vomit up,
And how! 't to find it.

Second Part Henry IV. act 1. sc. 6.

The strongest objection that can lie against a comparison is, that it consists in words only, not in sense. Such false coin, or bastard-wit, does extremely well in burlesque; but it is far below the dignity of the epic, or of any serious composition.

The noble sister of Popicola,
The moon of Rome; chaste as the icicle
That's curd'd by the frost from purest snow,
And hangs on Dian's temple.

Coriolanus, act 5. sc. 3.

There is evidently no resemblance between an icicle and a woman, chaste or unchaste: but chastity is cold in a metaphorical sense, and an icicle is cold in a proper sense; and this verbal resemblance, in the hurry and glow of comparing, has been thought a sufficient foundation for the simile. Such phantom similes are mere witticisms, which ought to have no quarter, except where purposely introduced to provoke laughter. Lucian, in his dissertation upon history, talking of a certain author, makes the following comparison, which is verbal merely.

"This author's descriptions are so cold, that they
surpass the Caspian snow, and all the ice of the
north."

—But for their spirits and souls

This word *rebellion* had froze them up
As fish are in a pond.

Second Part Henry IV. act 1. sc. 3.

Pope has several similes of the same stamp.
And hence one master passion in the breast,
Like Aaron's serpent swallows up the rest.

Epist. 2. l. 131.

And again, talking of this same ruling or master passion:
Nature its mother, Habit is its nurse;
Wit, spirit, faculties, but make it worse;
Reason itself but gives it edge and pow'r;
As heav'n's blest'd beam turns vinegar more fowr.

Ibid. l. 145.

Where the subject is burlesque or ludicrous, such similes are far from being improper. Horace says pleasantly,

Quamquam tu levior cortice.

Lib. 3. od. 9.

And Shakspear,

In breaking oaths he's stronger than Hercules.

And this leads to observe, that besides the foregoing comparisons, which are all serious, there is a species, the end and purpose of which is to excite gaiety or mirth. Take the following examples.

Falstaff, speaking to his page:

"I do here walk before thee, like a fow that
hath overwhelmed all her litter but one."

Second part Henry IV. act 1. sc. 10.

"I think he is not a pick-purse, nor a horse-
stealer; but for his verity in love, I do think him
as concave as a covered goblet, or a worm-eaten
nut."

As you like it, act 3. sc. 10.

This sword a dagger had his page,

That was but little for his age;

And therefore waited on him fo,

As dwarfs upon knights-errant do.

Hudibras, canto 1.

"Books, like men, their authors, have but one
way of coming into the world; but there are
ten thousand to go out of it, and return no more."

Tales of a Tub.

"The most accomplished way of using books at
present is, to serve them as some do lords, learn
their titles, and then brag of their acquaintance."

Ibid.

"He does not consider, that sincerity in love is
as much out of fashion as sweet stuff; no body
takes it now."

Charles's Husband.

COMPARTITION, in architecture, denotes the useful and graceful disposition of the whole ground-plot of an edifice, into rooms of office, and of reception or entertainment.

COMPARTMENT, in general, is a design composed of several different figures, disposed with symmetry; to adorn a parterre, a ceiling, &c.

A compartment of tiles or bricks, is an arrangement of them, of different colours, and varnished, for the decoration of a building. Compartments in gardening, are an assemblage of beds, plats, borders, walks, &c. disposed in the most advantageous manner that the ground will admit of. Compartments in heraldry are otherwise called partitions.

COMPASS, or *Mariner's COMPASS*, is an instrument whereby the ship's course is determined. See NAVIGATION, sect. 1. 15. and MARINER'S COMPASS.

The compass being of the utmost consequence to navigation, it is reasonable to expect that the greatest attention should be used in its construction, and every attempt to improve it carefully examined, and, if proper, adopted. But so careless are the generality of commanders of this most useful instrument, that almost all the compasses used on board merchant-ships have their needles formed of two pieces of steel-wire, each of which is bent in the middle, so as to form an obtuse angle; and their ends, being applied together, make an acute one; so that the whole represents the form of a lozenge; in the centre of which, and of the card, is placed the brass cap. Now, if we examine

mine a number of these cards, we shall rarely, if ever, find them all in the same direction, but they will all vary more or less, not only with regard to the true direction, but from one another.

These irregularities are owing to the structure of the needle ; for the wires of which it is composed are only hardened at the ends ; now, if these ends are not equally hard, or if one end be hardened up higher than the other, when they come to be put together, in fixing them to the card, that end which is hardest will destroy much of the virtue of the other ; by which means the hardest end will have the most power in directing the card, and consequently make it vary toward its own direction : and, as the wires are disposed in the form of a lozenge, these cards can have but little force, so that they will often, when drawn aside, stand at the distance of several degrees on either side the point from whence they are drawn : for all magnetical bodies receive an additional strength by being placed in the direction of the earth's magnetism, and act proportionably less vigorously when turned out of it ; wherefore, when these kind of needles are drawn aside from their true point, two of the parallel sides of the lozenge will conspire, more directly than before, with the earth's magnetism ; and the other two will be less in that direction : by which means the two sides will very much impede its return ; and the two latter will have that impediment to overcome, as well as the friction, by their own force alone.

To remove these inconveniences, some needles are made of one piece of steel of a spring temper, and broad towards the ends, but tapering towards the middle, where a hole is made to receive the cap. At the ends they terminate in an angle, greater or less according to the skill or fancy of the workman. These needles, though infinitely preferable to the other, are, however, far from being perfect ; for every needle of this form hath six poles instead of two, one at each end, two where it becomes tapering, and two at the hole in the middle : this is owing to their shape ; for the middle part being very slender, it has not substance enough to conduct the magnetic stream quite through, from one end to the other : all these poles appear very distinctly, when examined with a glass that is sprinkled over with magnetic sand. This circumstance, however, does not hinder the needle from pointing true ; but as it has less force to move the card than when the magnetic stream moves in large curves from one end to the other, it is certainly an imperfection.

These inconveniences induced the ingenious Dr Knight to contrive a new sea-compass, which is now used on board all the ships of war. The needle in this instrument is quite straight, and square at the ends ; and consequently has only two poles, though about the hole in the middle, the curves are a little confused. Needles of this construction, after vibrating a long time, will always point exactly in the same direction ; and if drawn ever so little on one side, will return to it again, without any sensible difference. We may therefore conclude, that a regular parallelopiped is the best form for a needle, as well as the simplest, the holes for the caps being as small as possible.

And as the weight should be removed to the greatest distance from the centre of motion, a circle of brass, of the same diameter of the card, may be added, which will serve also to support the card, which may then be made of thin paper, without any thing to stiffen it. This ring being fixed below the card, and the needle above it, the centre of gravity is placed low enough to admit of the cap being put under the needle, whereby the hole in the needle becomes unnecessary.

The above observations will be easily understood from viewing the several parts of the instrument as represented on Plate LXXXIII. fig. 3. where n^o 1. is the card, with the needle K L, and its cap M, fixed upon it, being one-third of the diameter of the real card.

N^o 3, is a perspective view of the backside of the card, where A B represents the turning down of the brass edge, C the under part of the cap, D and E two sliding weights to balance the card, and F, G, two screws that fix the brass edge, &c. to the needle.

N^o 2, is the pedestal that supports the card, containing a screwing needle, fixed in two small grooves to receive it, by means of the collet C, in the manner of a port-crayon. D, the stem, is filed into an octagon, that it may be the more easily unscrewed.

Azimuth COMPASS. See AZIMUTH.

COMPASS-DIALS, are small horizontal dials, fitted in brass or silver boxes, for the pocket, to shew the hour of the day, by the direction of a needle that indicates how to place them right, by turning the dial about till the cock or style stand directly over the needle ; but these can never be very exact, because of the variation of the needle itself. See COMPASS, and DIAL-LING.

COMPASSES, or *Pair of COMPASSES,* a mathematical instrument for describing circles, measuring figures, &c.

The common compasses consist of two sharp-pointed branches or legs of iron, steel, brass, or other metal, joined together at the top by a rivet, whereon they move as on a centre.

The principal perfection of this, as of all other compasses, consists in the easy and uniform opening and shutting of their legs ; one of which may be taken out, in order to make room for others.

There are now used compasses of various kinds and contrivances, accommodated to the various uses they are intended for ; as,

COMPASSES of three Legs are, setting aside the excess of a leg, of the same structure with the common ones : their use being to take three points at once, and so to form triangles ; to lay down three positions of a map, to be copied at once, &c.

Beam COMPASSES consist of a long branch, or beam, carrying two brass cursors, the one fixed at one end, the other sliding along the beam, with a screw to fasten it on occasion. To the cursors may be screwed points of any kind, whether steel, for pencils, or the like. It is used to draw large circles, to take great extents, &c.

Caliber COMPASSES. See CALIBER.

Clockmaker's COMPASSES are joined like the com-

Compasses, *mon compasses*, with a quadrant, or bow, like the spring compasses; only of different use, serving here to keep the instrument firm at any opening. They are made very strong, with the points of their legs of well tempered steel, as being used to draw lines on paste-board or copper.

Cylindrical and Spherical COMPASSES, consist of four branches, joined in a centre, two of which are circular, and two flat, a little bent on the ends: their use is to take the diameter, thickness, or caliber of round or cylindric bodies; such as cannons, pipes, &c.

Elliptic COMPASSES consist of a cros ABGH, (plate LXXXIV. fig. 9.) with grooves in it, and an index CE, which is fastened to the cros by means of dove-tails at the points CD, that slide in the grooves; so that when the index is turned about, the end E will describe an ellipse; which is the use of these compasses.

German COMPASSES have their legs a little bent outwards, towards the top; so that when shut, the points only meet.

Lapidary's COMPASSES are a piece of wood, in form of the shaft of a plane, cleft at top, as far as half its length; with this they measure the angles, &c. of jewels and precious stones, as they cut them. There is in the cleft a little brass rule, fastened there at one end by a pin; but so that it may be moved in the manner of a brass level: with this kind of square they take the angles of the stones, laying them on the shaft as they cut them.

Proportional COMPASSES are such as have two legs, but four points, which, when opened, are like a cros, as not having the joint at the end of the legs like common compasses: some of these have fixed joints, others moveable ones; upon the legs of the latter of which are drawn the lines of chords, sines, tangents, &c. Their use is to divide lines and circles into equal parts; or to perform the operations of the sector at one opening of them.

Spring-COMPASSES, or dividers; those with an arched head, which by its spring opens the legs; the opening being directed by a circular screw fastened to one of the legs, and let through the other, worked with a nut. These compasses are made of hardened steel.

Trifecting COMPASSES consist of two central rules, and an arch of a circle of 120 degrees, immovable, with its radius; which is fastened with one of the central rules like the two legs of a sector, that the central rule may be carried through all the points of the circumference of the arch. The radius and rule should be as thin as possible; and the rule fastened to the radius should be hammered cold, to attain the greater elasticity; and the breadth of the central rule should be triple that of the radius: there must also be a groove in this rule, with a dove-tail fastened on it for its motion, and a hole in the centre of each rule. The use of this instrument is to facilitate the trifecting of angles geometrically; and it is said to have been invented by M. Tarragen for that purpose.

Turn-up COMPASSES. The body of this instrument is like the common compasses: but towards the bottom of the legs, without-side, are added two other points besides the usual ones; the one whereof carry a drawing pen point, and the other a port-crayon,

both adjusted so as to turn round, and be in the way of use, or out of it, as occasion requires. These compasses have been contrived to save the trouble of changing the points.

COMPATIBLE, something that may suit, or consist with another. See *INCOMPATIBLE*.

COMPEIGNE, a handsome town of the isle of France, in the county of Senlis, with a palace, or castle, where the king often resides. The maid of Orleans was taken prisoner here in 1430. It is seated on the river Oise, near a large forest. E. Long. 3. 12. N. Lat. 49. 25.

COMPENDIUM, in matters of literature, denotes much the same as epitome or abridgement. See *ABRIDGEMENT*.

COMPENSATION, in a general sense, an action whereby any thing is admitted as an equivalent to another.

COMPENSATION, in law. Where the same person is debtor and creditor to another, the mutual obligations, if they are for equal sums, are extinguished by compensation; if for unequal, the lesser obligation is extinguished, and the greater diminished, as far as the concurrence of debt and credit goes.

COMPETENCE, or *COMPETENCY*, in a general sense, such a quantity of any thing as is sufficient.

COMPETENCE, in law, the right or authority of a judge, whereby he takes cognizance of any thing.

COMPETENTES, an order of catechumens, in the primitive Christian church, being the immediate candidates for baptism. See *CATECHUMEN*.

COMPETITION, in a general sense, is the same with rivalry, or when two or more persons contend for the same thing.

COMPETITION, in Scots law. In escheats, see *LAW*, Part III. N^o clxvi. 17, &c. In confirmations by the superior, in resignations, and in personal rights of lands, *ibid.* clxviii. 5.—9. In inhibitions, in adjudications, amongst assignees, arresters, and pinders, *ibid.* clxxi. 6. clxxii. 3. clxxvii. 2. clxxviii. 8, 9, 10. Amongst creditors of a defunct, clxxxi. 19.

COMPITALIA, or *COMPITALITA*, feasts held among the ancients in honour of the *lares*. The word comes from the Latin *compitum*, a cross-way; by reason the feast was held in the meeting of several roads. The *compitalia* are more ancient than the building of Rome. Dionysius Halicarnassensis, and Pliny, indeed, say, they were instituted by Servius Tullus; but this only signifies that they were then introduced into Rome. The feast being moveable, the day whereon it was to be observed was proclaimed every year. It was ordinarily held on the 4th of the nones of February, *i. e.* on the 2^d of that month. Macrobius observes, that they were held not only in honour of the *lares*, but also of *mania*, madnefs. The priests who officiated at them were slaves and liberti, and the sacrifice a sow. They were re-established, after a long neglect, by Tarquin the Proud, on occasion of an answer of the oracle, that they should sacrifice heads for heads; *i. e.* that for the health and prosperity of each family, children were to be sacrificed: but Brutus, after expelling the kings, in lieu of those barbarous victims substituted the heads of garlic and poppy; thus satisfying the oracle which had enjoined

capita,

Compatible

Compitalia

Complement
+
Composite.

capita, heads. During the celebration of this feast, each family placed at the door of their house, the statue of the goddess *Mania*: they also hung up at their doors figures of wool, representing men and women; accompanying them with supplications that the lares and mania would be contented with those figures, and spare the people of the house.

COMPLEMENT, in geometry, is what remains of the quadrant of a circle, or 90°, after any certain arch has been taken away from it. Thus, if the arch taken away be 40°, its complement is 50; because 90-40=50. The sine of the complement of an arch is called the *co-sine*, and that of the tangent the *co-tangent*, &c.

COMPLETUS FLOS, in botany. A flower is said to be complete, which is provided with both the covers, *viz.* the calix or flower-cup, and the petals. The term was invented by Vaillant, and is synonymous to *calyculatus flos* in Linnaeus. Berkenhout erroneously contends it with the *austus* and *calyculatus calix* of the same author.

COMPLEX, in a more general sense, a term synonymous with compound; though, in strictness of speech, there is some difference.

Complex is properly applied where a thing contains divers others, or consists of divers parts not really distinct from each other, but only imaginarily, or in our conceptions. In this sense the soul may be said to be complex, in respect of the understanding and will, which are two things that our reason alone distinguishes in it.

Complex Term or *Idea*, is a term compounded of several simple or incomplex ones. Thus in the proposition, *A just God cannot leave crimes unpunished*; the subject of this proposition, *viz.* a just God is a complex term, or stands for a complex idea composed of two simple or incomplex ones, *viz.* God and just.

COMPLEXION, among physicians, the temperament, habitude, and natural disposition, of the body; but more often the colour of the face and skin. See *COLOUR of the Human Species*.

COMPLEXUS, and **COMPLEXUS Minor**, or *Tracheo-mastoidæus*: two muscles in the posterior part of the trunk. See *ANATOMY, Table of the Muscles*.

COMPLICATION, in general, denotes the blending, or rather interweaving, of several different things together: thus a person afflicted with several disorders at the same time, is said to labour under a complication of disorders.

COMPLINE, the last division of the Romish breviary. It was instituted to implore God's protection during the night, as the *prime* is for the day. It is recited after sunset, and is so called, because it completes the office for the 24 hours.

COMPOUND, **COMPOSE**, or **GOSONY**, in heraldry, is said of a bordure made up of angular parts, or chequers, of alternate metals and colours. See *HERALDRY, N° II. examp. 8*.

COMPOSITE, in general, denotes something compounded, or made up of several others united together; thus,

COMPOSITE Numbers, are such as can be measured exactly by a number exceeding unity; as 6 by 2 or

3, or 10 by 5, &c. so that 4 is the lowest composite number. Composite numbers, between themselves, are those which have some common measure besides unity; as 12 and 15, as being both measured by 3.

COMPOSITE Order, in architecture, the last of the five orders of columns; so called because its capital is composed out of those of the other columns, borrowing a quarter-round from the Tuscan and Doric, a row of leaves from the Corinthian, and volutes from the Ionic. Its cornice has simple modillions or dentils. It is also called the *Roman* or *Italic* order, as having been invented by the Romans. By most authors it is ranked after the Corinthian, either as being the next richest, or the last invented. See *ARCHITECTURE, N° 53*.

COMPOSITION, in a general sense, the uniting or putting together several things, so as to form one whole, called a *compound*.

COMPOSITION of Ideas, an act of the mind, whereby it unites several simple ideas into one conception or complex idea.

When we are provided with a sufficient stock of simple ideas, and have by habit and use rendered them familiar to our minds, they become the component parts of other ideas still more complicated, and form what we may call a second order of compound notions. This process may be continued to any degree of composition we please, mounting from one stage to another, and enlarging the number of combinations.

COMPOSITION, in grammar, the joining of two words together; or prefixing a particle to another word, to augment, diminish, or change its signification.

COMPOSITION, in logic, a method of reasoning whereby we proceed from some general self-evident truth, to other particular and singular ones.

In disposing and putting together our thoughts, there are two ways of proceeding, equally within our choice: for we may suppose the truths, relating to any part of knowledge, as they presented themselves to the mind, in the manner of investigation; carrying on the series of proofs in a reverse order, till they, at last, terminate in first principles: or beginning with these principles, we may take the contrary way, and from them deduce, by a direct train of reasoning, all the several propositions we want to establish.

This diversity, in the manner of arranging our thoughts, gives rise to the twofold division of method established among logicians; the one called *analytic* method, or the method of *resolution*, inasmuch as it traces things back to their source, and resolves knowledge into its first and original principles. This method stands in contradistinction to the method of composition; or, as it is otherwise called, the *synthetic* method: for here we proceed by gathering together the several scattered parts of knowledge, and combining them into one system, in such a manner, as that the understanding is enabled distinctly to follow truth through all the different stages of gradation.

COMPOSITION, in music, is the art of inventing, and writing airs; of accompanying them with a suitable harmony; in short, of forming a complete piece of music in all its parts.

The knowledge of melody, harmony, and its rules, is the foundation of composition. Without doubt, it

Composite
+
Composition.

Compo-
sition.

It is necessary to know in what manner chords should be filled, how to prepare and resolve dissonances, how to find the fundamental bass, and how to put in practice all the other minutiae of elementary knowledge; but with the mechanical rules of harmony alone, one is by no means better qualified to understand the art, and operate in the practice of composition, than to form himself for eloquence upon all the rhetorical precepts exhibited in grammar. We need not say, that besides this, it is necessary to understand the genius and compass of voices and instruments; to judge what airs may be of easy, and what of difficult, execution; to observe what will, and what will not, be productive of any effect; to feel the character of different movements, as well as that of different modulations, that both may be always suitably applied; to know the different rules established by convention, by taste, by caprice, or by pedantry, as fugues, imitations, or in pieces where the subject is confined to uniform laws in its harmony, melody, rhythmus, &c. All these acquisitions are still no more than preparatives for composition: but the composer must find in his own genius the sources of beautiful melody, of sublime harmony, the picturesque, and the expressive in music; he must, in short, be capable of perceiving, and of forming, the order of the whole piece; to follow the relations and aptitudes of which it is susceptible in every kind; to inflame his soul with the spirit and enthusiasm of the poet, rather than childishly amuse himself with punning in harmony, or adapting the music to each particular word. It is with reason that our musicians have given the name of *words* to the poems which they set to music. It appears evident from their manner of expressing them, that, in their apprehension, they seemed words, and words alone. One would be tempted to imagine, particularly during some of these last years, that the rules for the formation and succession of chords have caused all the rest to be neglected or forgot; and that harmony has made no acquisitions, but at the expence of what is general and essential in the musical art. All our artists know how to fill a chord with its constituent sounds, or a piece of harmony with its constituent parts; but not a soul amongst them feels a ray of composition. As to what remains, though the fundamental rules of counter-point, or music in parts, continue still the same, they are more or less rigorous and inflexible in proportion as the parts increase in number; for according as the parts are multiplied, the difficulty of composition is heightened, and the rules are less severe.—Compositions in two parts are called *duets*, when the two performers sing equally; that is to say, when the subject is no further extended, but divided between them. But if the subject is in one part alone, and the subordinate harmony no more than an accompaniment, the first part is then either called a *recitative* or a *solo*; and the other, an *accompaniment*, or *continued bass*, if it is a bass. It is the same case with the *trio*, with compositions in three, in four, or in five parts.

The name of *composition* is likewise given to such pieces of music themselves, as are formed according to the rules of the art. For this reason the *duets*, *trios*, *quartets*, which have just been mentioned, are called *compositions*.

Compo-
sition.

Compositions are either formed for the voice alone, or for instruments, or for voices and instruments joined. Full choruses and songs are the only compositions principally intended for the voice, though sometimes instruments are joined with it to support it. Compositions for instruments are intended to be executed by a band in the orchestra, and then they are called *symphonies*, *concertos*; or for some particular species of instruments, and then they are called *pieces* or *sonatas*.

Such compositions as are destined both for voices and instruments, have been generally divided into two capital species, viz. the *sacred*, and the *secular*. The compositions destined for the church, whether psalms, hymns, anthems, or responses, are in general distinguished by the name of *church-music*, and characterized by their intention to be sung with words. Secular music in general may likewise be divided into two kinds; *theatrical* and *chamber music*. Of the first kind, is that used in the operas; the subdivisions of the second are endless. Solos, concertos, cantatas, songs, and airs, almost of every kind, which are not adapted to the church or the stage, may be included in the idea of *chamber-music*.

In general, it is thought, that sacred music requires deeper science, and a more accurate observation of rules; the secular species gives more indulgence to genius, and subsists in greater variety.

But we must here observe, that the ecclesiastical music now used, or rather profaned and murdered, amongst us, though regular in its harmony, is simple in its composition, and demands not that profound knowledge in the art, either to form or comprehend it, which Rousseau whom till now, we have followed in this article, seems to imagine. His assertion can only be applicable to the church-music of Italy. That which is now established amongst us, seems not to be indigenous, but transferred with the Calvinistical liturgy from Geneva; and as it is intended for popular use, it can by no means be esteemed an high exertion of the musical art: yet, however simple, it is pleasing; and, when properly performed, might elevate the soul to a degree of devotion, and even of rapture, which at present we are so far from feeling, that we rather seem to sleep or to howl, than to sing the praise of God. Perhaps our clergy may find more advantage in cultivating their farms; but they would surely feel a higher and diviner pleasure, in cultivating the tastes and voices of their people. The one, however, is not incompatible with the other. An hour of relaxation in a winter-evening might serve for the accomplishment of this pious purpose; and one should imagine, that, independent of religious considerations, the spirit of the craft might dictate such a measure as calculated to produce popular intertainment and gain popular affection.

In composition, the author either confines himself, as a subject, to the mere mechanical modulations and arrangements of sound; and, as his end, to the pleasure of the ear alone; or otherwise he pursues a nobler height; he aspires to imitative music; he endeavours to render the hearts and souls of his auditors docile by his art, and thus to produce the noblest emotions and most salutary effects. In the first view, it is only necessary,

Composi-
tion
↓
Compositus

necessary, that he should look for beautiful sounds and agreeable chords; but in the second, he ought to consider music in its conformity with the accents of the human voice, and in the expressive powers of notes harmonically combined to signify or paint such objects as are susceptible of imitation. In Rousseau's article *opera*, some ideas may be found by which the art may be ennobled and elevated, by forming music into a language more powerful and pathetic than eloquence itself. See *OPERA*.

COMPOSITION, in literature, the art of forming and arranging sentiments, and cloathing them with language suitable to the nature of the subject or discourse. See the articles *LANGUAGE*, *ORATORY*, and *POETRY*.

COMPOSITION, in chemistry, is the union and combination of several substances of different natures, from which a compound body results. From this union of bodies of different natures, a body is formed, of a mixed nature, which Becker and Stahl have called a *mixture*, and which may be called a *combination*, or *chemical composition*, to avoid the equivocal sense of the word *mixture*. By this last, we understand only a mere apposition of parts; and which would therefore give a very false idea of chemical composition, in which a mutual adhesion takes place between the combined substances.

COMPOSITION, in painting, includes the invention as well as disposition of the figures, the choice of attitudes, &c.

Composition, therefore, consists of two parts; one of which finds out, by means of history, proper objects for a picture; and the other disposes them to advantage. See *PAINTING*.

COMPOSITION, in pharmacy, the art or act of mixing divers ingredients together into a medicine so as they may assist each other's virtues, supply each other's defects, or correct any ill qualities thereof. See *PHARMACY*.

COMPOSITION, in commerce, a contract between an insolvent debtor and his creditors, whereby the latter accept of a part of the debt in composition for the whole, and give a general acquittance accordingly.

COMPOSITION, in printing, commonly termed *compositing*, the arranging of several types or letters in the composing-stick, in order to form a line; and of several lines ranged in order, in the galley, to make a page; and of several pages to make a form. See *PRINTING*.

COMPOSITÆ, in botany. The name of a class in Hermannus and Royen; as likewise, of an order in Linnæus's fragments of a natural method, consisting in general of the plants which have the characters enumerated in the following article. A particular description of this order, is given under the article *SYNGENESIA*, which includes all the compound flowers.

COMPOSITUS FLOS, in botany, an aggregate flower composed of many *flosculi sessiles*, on a common entire receptaculum, with a common perianthium, and whose anthers being five in number unite in the form of a cylinder; the flosculi are monopetalous, and under each of them is a monospermous germen.

Compound flowers are either *ligulati*, *tubulosi*, or *radiati*. Composit.

COMPOST, in agriculture, denotes a certain kind of mixture designed to assist the soil in the way of vegetation, instead of dung. The requisites for a compost are, 1. That it ought to be cheaper than the quantity of dung required for an equal extent of soil. 2. It ought to be less bulky; and 3. It ought to produce equal effects.

Under the article *AGRICULTURE*, we have endeavoured to shew, that the true vegetable food consists in reality of the putrid effluvia proceeding from decayed animal and vegetable substances. If this theory is admitted, the hope of making composts as a succedaneum for dung is but very small, unless they are made of putrefied animal and vegetable substances, in which case, unless in very singular circumstances, they will prove much dearer than dung itself. Several attempts, however, have been made by those who had other views concerning the nature of the true vegetable food. An oil-compost is recommended in the Georgical Essays, upon a supposition that the food of vegetables is of an oily nature. It is made as follows: "Take of North-American potash 12^{lb}. Break the salt into small pieces, and put it into a convenient vessel with four gallons of water. Let the mixture stand 48 hours, then add coarse train oil 14 gallons. In a few days the salt will be dissolved, and the mixture, upon stirring, will become nearly uniform. Take 14 bushels of sand, or 20 of dry mold; upon these pour the above liquid ingredients. Turn this composition frequently over, and in six months it will be fit for use. When the liquid ingredients are put to one or two hogheads water, a liquid compost will be formed, which must be used with a water cart."

This compost, however, the inventor himself owns to be inferior to rotten dung, as indeed may very naturally be supposed; yet in some cases it seems capable of doing service, as will appear from some of the following experiments which we extract from the essays above-mentioned.

Exp. I. By the author of the essays. "I took four pots, n^o 1, 2, 3, 4. N^o 1. contained 12^{lb} of barren sand, with 1^{oz} of the sand oil compost. N^o 2. contained 12^{lb} of sand without any mixture. N^o 3. had 12^{lb} of sand with half an ounce of flaked lime. N^o 4. had 12^{lb} of sand with 4^{oz} of the sand oil-compost. In the month of March, I put six grains of wheat into each pot, and during the summer, I occasionally watered the plants with filtrated water. All the time the plants were consuming the farina, I could observe very little difference in their appearance. But after one month's growth, I remarked that n^o 1. was the best; n^o 2. the next; n^o 3. the next; and n^o 4. much the worst." The same differences were observed in August, when n^o 1. the best, had five small ears, which contained a few poor grains of wheat.

Exp. II. By the same. "In the month of June, I selected four lands of equal goodness in a field intended for turnips. The soil was a light sand, with a tolerable quantity of vegetable earth amongst it. It was plowed out of sward in November, and had not borne a crop for many years. I shall distinguish my experimental lands by n^o 1, 2, 3, 4. N^o 1. was manured with

Compost.

Compost.

with rotten dung; n° 2. with oil compost; n° 3. with lime; n° 4. was left without any dressing. On the 20th of June they were all sown with turnip-seed broadcast, and during the course of the season were twice hoed. In November I viewed the field, and made the following remarks. N° 1. the best; n° 2. the next; n° 3. the worst; n° 4. better than n° 3." Here the oil compost appears in a favourable light; but other trials, made with equal accuracy, seem rather to prove, that it is not proper for turnips, barley, or quick growing vegetables. It requires being meliorated by the atmosphere, and therefore is better adapted for winter crops.

Exp. III. by the fame. "In the month of May, I planted 12 alleys that lay between my asparagus beds with cauliflower plants. Each alley took up about 30 plants. One of the alleys I set apart, for an experiment with the oil-compost, prepared according to the directions already given. About an handful of the compost was put to the root of each cauliflower plant. In all other respects the alley was managed like the rest. The plants in general flowered very well; but those to which I applied the compost sprung up hastily with small stalks, and produced very poor flowers. I imputed this unfavourable appearance to the freshness of the compost, which was only a few weeks old. In the September following this unsuccessful experiment, I planted the same alleys with early cabbages. The necessity of meliorating the compost was in this trial fully confirmed. For the cabbages that grew upon the alley, which in May had received the compost, were larger and in all respects finer than the others."

Exp. IV. by James Stovin, Esq; of Doncaster. "In the year 1769, I made the following trial with the oil-compost, prepared as above directed. One acre sown with barley, and manured with oil-compost at 18s. produced five quarters, five bushels. An acre adjoining, sown with barley, and manured with 12 loads of rotten dung at 3l. produced four quarters three bushels and two pecks. The compost-barley was bolder and better corn than the other. In the year 1770, the dunged acre produced of rye, three quarters. The compost acre of ditto, two quarters six bushels. In the year 1771, the same lands were sown with oats, and the produce was greatly in favour of the dunged acre. These experimental lands were in a common field that had been long under the plough."

Exp. V. by Richard Townly, Esq; of Belfield. "In the spring 1770, I prepared a piece of ground for onions. It was laid out into six beds of the same size, and which were all sown at the same time. Over two of them, the oil-compost was scattered in a very moderate quantity. Over other two, pigeons dung; and over the remaining two, some of my *weed-compost*, (formed of putrefied vegetables) which I esteem one of the best manures, for most vegetables, that can be made. The onions came up very well in all the beds; but, in about six weeks, those that were fed with the oil-compost, plainly discovered the advantage they had over the rest, by their luxuriance and colour, and at the end of the summer perfected the finest crop I had ever seen, being greatly superior to the

others both in quantity and size. The same spring I made an experiment upon four rows of cabbages, set at the distance of four feet every way. Two were manured with oil-compost, and two with my own. All the plants were unluckily damaged, just before they began to form, by some turkeys getting into the field and plucking off the greatest part of the leaves. However, they so far recovered, in the September following, from 22 to 28 ^{lb} a-piece. The rows proved so equal in goodness, that I could not determine which had the advantage. The same year, one part of a field of wheat exposed to the north-east winds, which, that spring, continued to blow for a month or five weeks, appeared very poor and languid at the time of tillering. Over it I ordered some of the oil-compost to be sown with the hand; which not only recovered, but also pushed forwards the wheat plants in that part of the field, so as to make them little inferior, if any, to the rest. The same spring, I made a comparative experiment, upon four contiguous lands of oats, between the oil-compost and my own weed-compost. The latter had manifestly the advantage, though the other produced a very large and fine crop. I also tried the oil-compost upon carrots, and it answered exceedingly well. I did the same this year (1771) both upon them and my onions, and have the finest crops of these vegetables I ever saw any where upon the same compass of ground."

Exp. VI. by Mr J. Broadbent of Berwick, in Elmet near Leeds.—"On the first of October 1771, I sowed two acres of a light channelly soil with wheat, and harrowed in the compost with the grain. Being at a considerable distance from a large town, we find it very difficult and expensive to procure rotten dung in sufficient quantity for our tillage lands, for which reason we have recourse to land dressings both for our winter and spring-corn. Rape-dust and foot are principally used; but the present price of both these articles is a heavy tax upon the farmer. To obviate that inconvenience, I resolved to make trial of the oil-compost; and from what I have observed in this one experiment, I am encouraged to make a more extensive use of it the next year. Being well acquainted with the nature and efficacy of foot, I am satisfied, that the above two acres produced as good a crop of wheat as if they had been dressed with that excellent manure."

On the supposition that vegetables are supported by matters of a saline nature, composts formed of different sorts of salts have been contrived, but with less success than the one above treated of. A famous composition of this kind, was lately sold by patent, under the name of Baron Van Haak's compost. The following experiment is mentioned in the *Georgical Essays*, as made with a view to determine the virtues of it compared with the oil-compost and foot mixed with ashes.—"In the beginning of April 1773, an acre of land was sown with forward oats. I pitched upon one land in the middle of the piece, which I esteemed better than any of the rest, and upon this I scattered Baron Van Haak's compost, in the quantity directed in his instructions. On one side I manured a land with the oil-compost, but rather with a less quantity than directed; and, on the other side, I manured two lands with

Compost. with dry coal-ashes sifted fine, and an equal quantity of foot. The lands upon which this experiment was made, were much worn out with a long succession of crops. The lands which had the benefit of the ashes and foot, produced an exceeding fine crop; the oil-compost produced a tolerable good one; but that which had only the assistance of the baron's compost, produced a very poor one. It could not have been worse had it been left destitute of every assistance."

Composts, made with putrefied animal substances, will no doubt answer much better, in moist cases, than any other kind of manure, but they are difficult to be procured. The following is recommended by Dr Hunter of York.—"Take a sufficient quantity of saw-dust, incorporate it with the blood and offal of a slaughter-house, putting a layer of one and a layer of the other till the whole becomes a moist and fetid composition. Two loads of this compost, mixed with three loads of earth, will be sufficient for an acre of wheat, or spring-corn. Being a kind of top-dressing, it should be put on at the time of sowing, and harrowed in with the grain. The present year I have a field of wheat manured in this manner, and have the pleasure to say, that it is extremely clean, and has all the appearance of turning out an excellent crop. As this kind of compost lies in a small compass, it seems well adapted for the use of such farmers as are obliged to bring their manures from a distance. It is besides extremely rich, and will probably continue in the land much longer than fold-yard or stable-dung. I apprehend that it is capable of restoring worn out land to its original freshness; and I am induced to be of that opinion, from the appearance of the above crop, which is now growing upon land much impoverished by bad management."

Another compost, prepared from whales flesh, is recommended by Mr Charles Chaloner.—"I have a particular pleasure, (says he), in describing and making public the best method of forming a compost from whales flesh, as recommended to me by Dr Hunter. Having marked out the length and breadth of your intended dung-hill, make the first layer of earth about a foot in thickness. Moor-earth, or such as is taken from ant-hills, is the best for this purpose. Over the earth, lay one layer of long litter, from the fold-yard or stable, about 12 inches in thickness, then a layer of whale-flesh, and over that another layer of dung. Repeat the operations till the heap be raised about six feet, then give it a thick covering of earth, and coat the heap with fods. In this manner each layer of flesh will be placed between two layers of dung. In about a month turn the whole in the usual manner, which will occasion a strong degree of heat and fermentation. When turned, coat with earth as before, with a view to confine the putrid steam which would otherwise escape. In a month or two the heap will be found to be considerably fallen, when it should have a second turning as before. The operation of turning must be repeated at proper intervals, till the whole becomes a uniformly putrid mass. The whale-flesh is of different degrees of firmness, some of it being almost liquid; and, in proportion to its firmness, the heap will become sooner or later fit for use. In general, the compost should not be used till 12 months old; but that de-

VOL. III.

pends upon circumstances. Guard the heap from dogs, pigs, badgers, and vermin, as these animals are remarkably fond of whale-flesh. This animal-compost may with great advantage be applied to all purposes where good rotten dung is required. I have used it with great success for cabbages, and find it an excellent dressing for meadow-ground. According to the best computation, one hoghead of whale refuse, will make eight loads of dung, which, when we consider the great facility with which this basis of our dung-hill may be carried, is a momentous concern to such farmers as lie remote from a large town." See MANURE.

COMPOST in gardening, is a mixture of several earths, earthy substances, and dungs, either for the improvement of the general soil of a garden, or that of for some particular plants. Almost every plant delights in some peculiar mixture of soils or compost, in which it will thrive better than in others. The most remarkable and generally useful of these, are taken notice of under the description of the several botanical articles, as they occur in the order of the alphabet.

COMPOSTELLA, a celebrated town of Spain, and capital of Galicia, with an archbishop's see, and an university. The public squares, and the churches, particularly the Metropolitan church, are very magnificent. It has a great number of monasteries, for both sexes, and about 2000 houses. It is pretended that the body of St James was buried here, which draws a great number of pilgrims from most parts of Christendom. They walk in procession to the church, and visit his wooden image, which stands on the great altar, and is illuminated with 40 or 50 wax-candles. They kiss it three times, with a very respectful devotion, and then put their hats on its head. In the church there are 30 silver lamps, always lighted, and six chandeliers of silver, five feet high. The poor pilgrims are received into an hospital, built for that purpose, which stands near the church; and round it are galleries of free stone, supported by large pillars. The archbishop is one of the richest prelates in Spain, having 70,000 crowns a-year. From this town the military order of St Jago, or St James, had its original. It is seated in a peninsula, formed by the rivers Tambre and Ulla, in a pleasant plain. W. Long. 7. 17. N. Lat. 42. 54.

NEW COMPOSTELLA, a town of North America, in New Spain, and province of Xalisco, built in 1531. It is seated near the South Sea. W. Long. 110. 12. N. Lat. 21. 0.

COMPOUND, in a general sense, an appellation given to whatever is composed or made up of different things; thus we say, a compound word, compound sound, compound taste, &c.—Compound differs from *complex*, and stands opposed to *simple*. See COMPLEX and SIMPLE.

COMPOUND Flower. See COMPOSITUS Fls.

COMPOUND Interest, called also *interest upon interest*, is that which is reckoned not only upon the principal, but upon the interest itself forborn; which hereby becomes a sort of secondary principal. See INTEREST.

COMPOUND Motion, that motion which is effected by several conspiring powers. Powers are said to

12 U

conspire

Compost
Compound.

Compound
I
Compurgator.

Computa-
tion
I
Conception

conspire if the direction of the one be not quite opposite to that of the other; as when the radius of a circle is conceived to revolve about a centre, and at the same time a point to move straight along it.

COMPOUND Numbers, those which may be divided by some other number besides unity, without leaving any remainder; such are 18, 20, &c. the first being measured by the numbers 2, 6, or 9; and the second by the numbers 2, 4, 5, 10.

COMPOUND Quantities. See ALGEBRA, n° 4. **COMPOUND Ratio**, is that which the product of the antecedents of two or more ratios has to the product of their consequents. Thus, 6 to 72 is in a ratio compounded of 2 to 6, and of 3 to 12.

COMPOUND, (substantive), the result or effect of a composition of different things; or a mass formed by the union of many ingredients.

COMPRESS, in surgery, a bolster of soft linen cloth, folded in several doubles, frequently applied to cover a plaster, in order not only to preserve the part from the external air, but also the better to retain the dressings or medicines.

COMPRESSION, the act of pressing or squeezing some matter together, so as to set its parts nearer to each other, and make it possess less space. *Compression* properly differs from *condensation*, in that the latter is performed by the action of cold, the former by some external violence.

COMPROMISE, a treaty or contract, whereby two contending parties establish one or more arbitrators to judge of, and terminate their difference in an amicable manner.

COMPTON (Henry), bishop of London, was the youngest son of Spencer Earl of Northampton, and born in 1632. After the restoration of Charles II. he became cornet of a regiment of horse: but soon after quitting the army for the church, he was made bishop of Oxford in 1674; and about a year after translated to the see of London. He was entrusted with the education of the two princesses Mary and Anne, whom he also afterwards married to the princes of Orange and Denmark: and their firmness in the Protestant religion was in a great measure owing to their tutor, to whom, when popery began to prevail at court, it was imputed as an unpardonable crime. He was suspended from his ecclesiastical function by James II. but was restored by him again on the prince of Orange's invasion. He and the bishop of Bristol made the majority for filling the vacant throne with a king: he performed the ceremony of the coronation; was appointed one of the commissioners for raising the liturgy; and laboured with much zeal to reconcile dissenters to the church. His spirit of moderation made him unpopular with the clergy, and in all probability checked his further promotion. He died in 1713; but, living in busy times, did not leave many writings behind him.

COMPUCTION, in theology, an inward grief of mind for having offended God.

COMPURGATOR, one that, by oath, justifies another person's innocence. Compurgators were introduced as evidences in the jurisprudence of the middle ages. Their number varied according to the importance of the subject in dispute, or the nature of the

crime with which a person was charged.

COMPUTATION, in a general sense, the manner of estimating time, weights, measure, moneys, or quantities of any kind.

COMUS, in Pagan mythology, the god of nocturnal revels and festivals. He was represented as a young man crowned with roses or myrtle, holding in one hand a golden cup, and in the other a dish of fruit.

CONANT (Dr John), a learned English divine, born in 1608. He took his degrees at Exeter College Oxford; was, by the parliament, constituted one of the assembly of divines, though he seldom, if ever, sat with them; and in 1657 was admitted vice-chancellor of the university. On the restoration he was one of the commissioners, and assisted at the conferences in the Savoy; but was deprived by the act of uniformity: after eight years he was confirmed, and was made arch-deacon of Norwich, and prebendary of Worcester. In 1686 he lost his sight; and died in 1693; leaving a number of admired sermons, afterwards published in six volumes.

CONARION, or **CONOIDES**, a name for the pineal gland. See ANATOMY, n° 397. c.

CONATUS, a term frequently used in philosophy and mathematics, defined by some to be a quantity of motion, not capable of being expressed by any time, or length; as the *conatus recedendi ab axe mundi*, is the endeavour which a body, moved circularly, makes to recede, or fly off from the centre or axis of its motion.

CONCALE BAY, is on the coast of France in Brittany, where the English forces landed in June 1758, in order to go to St Maloes; which they did, and burnt all the ships in that harbour, which were above 100, of all sorts. Concale is the town which gives name to the bay, and is famous for oysters. It is 18 miles east of St Maloes, and 197 west of Paris. W. Long. 1. 47. N. Lat. 48. 41.

CONCARNEAU, a town of France, in Bretagne, with a harbour and a castle. E. Long. 3. 45. N. Lat. 47. 55.

CONCATENATION, a term chiefly used in speaking of the mutual dependence of second causes upon each other.

CONCAVE, an appellation used in speaking of the inner surface of hollow bodies, but more especially of spherical ones.

CONCAVE Glasses, such as are ground hollow, and are usually of a spherical figure, though they may be of any other, as parabolic, &c. All objects seen through concave glasses, appear erect and diminished.

CONCENTRATION, in general, signifies the bringing things nearer a centre. Hence the particles of salt, in sea-water, are said to be concentrated; that is, brought nearer each other, by evaporating the watery part.

CONCENTRIC, in mathematics, something that has the same common centre with another: it stands in opposition to *excentric*.

CONCEPTION, among physicians, &c. denotes the first formation of an embryo in the womb of its parent, who, from that time, becomes pregnant. See GENERATION.

Conception
Conception

CONCEPTION *Immaculate* of the holy virgin, is a feast established in honour of the holy virgin, particularly with regard to her having been conceived and born *immaculate*, i. e. without original sin, held in the Romish church on the 8th of December. The immaculate conception is the great head of controversy between the Scotists and Thomists; the former maintaining, and the latter impugning it. In the three Spanish military orders, of St James of the sword, Calatrava, and Alcantara, the knights take a vow at their admission to defend the immaculate conception. This reformation was first taken in 1652. Peter d'Alva has published 48 huge volumes in folio on the myteries of the conception.

CONCEPTION, an episcopal town of Chili in South America. It is situated in W. Long. 79. 12. S. Lat. 36. 43; and is the oldest European settlement in Chili, and the second in point of dignity. On their first settlement here, the Spaniards were repeatedly driven off by the Indians, so that they were obliged to take up their residence at St Jago. Since that time both the cities of Conception and St Jago have been frequently destroyed by earthquakes. In the year 1730 both of them were laid in ruins by a dreadful shock, the first concussions of which were attended with an unusual swelling of the sea, that overturned the few houses which had escaped the ravages of the earthquake. The harbour is good, and pretty much frequented, on which account the city is regarded as a place of consequence. The king allows annually 350,000 pieces of eight for the support of a garrison of 3500 men; a corps that is seldom complete. None of the fortifications are considerable; but those towards the land are wretched. The Spaniards now live in tolerable security with respect to the Indians, and have no notion of any attack from the land side. It is said indeed, that not only this but all the settlements in Chili and Peru would fall an easy prey to the attacks of a foreign enemy; the fortifications being in ruins, and the garri- sons scarce half the number required by the king: owing to the avarice, ignorance, and supine negligence of the governors, who study nothing but to enrich themselves.

CONCEPTION, a town of North America, in New Spain, and in the Audience of Guatimali. It is seated near the sea-coast, 100 miles west of Porto-bello, and a small river that runs into the sea. W. Long. 83. 5. N. Lat. 10. 0.

CONCERT, or **CONCERTO**, in music, a number or company of musicians, playing or singing the same piece of music or song at the same time.

CONCERTATO intimates the piece of music to be composed in such a manner, as that all the parts may have their recitatives, be it for two, three, four, or more voices or instruments.

CONCERTO GROSSI, the grand chorus of a concert, or those places where all the several parts perform or play together.

CONCESSION, in general, signifies either the act of granting or yielding any thing, or the thing itself which is so granted or yielded.

CONCESSION, in rhetoric, a figure, whereby something is freely allowed, that yet might bear dispute, to obtain something that one would have granted to

him, and which he thinks cannot fairly be denied, as in the following conceffion of Dido, in Virgil:

"The nuptials he disclaims, I urge no more;

"Let him pursue the promis'd Latian shore.

"A short delay is all I ask him now;

"A pause of grief, an interval from wo."

CONCHA, in zoology, a synonyme of the **MYTILUS**, **SOLE**, &c.

CONCHES, a town of Normandy, with a Benedictine abbey, which carries on a considerable trade. It is seated on the top of a mountain, in the territory of Ouche, 45 miles north-west of Paris. E. Long. 0. 51. N. Lat. 48. 58.

CONCHITES **MARMOR**, a name given by the ancients to a species of marble dug near Megara, and remarkable for containing a great number of sea-shells, and other marine bodies immersed in it.

CONCHOID, in geometry, the name of a curve, given to it by its inventor Nicomedes. See **FLUXIONS**.

CONCHYLIA, a general name for all petrified shells, as limpets, *cochleæ*, nautilus, conchæ, lepadæ, &c.

CONCIATOR, in the glass art, is, for the crystal-glass, what the founder is at the green-glass houses. He is the person that weighs and proportions the salt on ashes and sand, and works them with a strong fire till they run into lumps and become white; and if the metal be too hard, and consequently brittle, he adds salt or ashes, and if too soft, sand; still mixing them to a fit temper, which is only known by the working.

CONCINNOUS INTERVALS, in music, are such as are fit for music, next to, and in combination with concords; being neither very agreeable nor disagreeable in themselves; but having a good effect, as by their opposition they heighten the more essential principles of pleasure; or as, by their mixture and combination with them, they produce a variety necessary to our being better pleased.

CONCINNOUS System, in music. A system is said to be concinnous, or divided concinnously, when its parts, considered as simple intervals, are concinnous; and are besides placed in such an order between the extremes, as that the succession of sounds, from one extreme to the other, may have an agreeable effect.

CONCLAVE, the place in which the cardinals of the Romish church meet, and are shut up, in order to the election of a pope.

The conclave is a range of small cells, 10 feet square, made of waincot: these are numbered, and drawn for by lot. They stand in a line along the galleries and hall of the Vatican, with a small space between each. Every cell has the arms of the cardinal over it. The conclave is not fixed to any one determinate place, for the constitutions of the church allow the cardinals to make choice of such a place for the conclave as they think most convenient; yet it is generally held in the Vatican.

The conclave is very strictly guarded by troops: neither the cardinals, nor any person shut up in the conclave, are spoke to, but at the hours allowed of, and then in Italian or Latin; even the provisions for the conclave are examined, that no letters be conveyed by that means from the ministers of foreign powers, or other persons who may have an interest in the election of the pontiff.

Concession
Conclave

Conclave
Concretion.

Concubinage
Conde.

CONCLAVE is also used for the assembly, or meeting, of the cardinals shut up for the election of a pope.
CONCLUSION, in logic, the consequence or judgment drawn from what was asserted in the premises; or the previous judgments in reasoning, gained from combining the extreme ideas between themselves.

CONCOCTION, in medicine, the change which the food undergoes in the stomach, &c. to become chyle. See **CHYLE**.

CONCOMITANT, something that accompanies or goes along with another.

CONCORD, in grammar, that part of construction called *syntax*, in which the words of a sentence agree; that is, in which nouns are put in the same gender, number, and case; and verbs in the same number and person with nouns and pronouns.

CONCORD, in music, the relation of two sounds that are always agreeable to the ear, whether applied in succession or consonance.

CONCORDANCE, a sort of dictionary of the Bible, explaining the words thereof in alphabetical order, with the several books, chapters, and verses quoted, in which they are contained.

CONCORDANT VERSES, such as have several words in common; but which, by the addition of other words, convey an opposite, at least a different meaning. Such are those,

Et cavis in silva { *venatur* } & *omnia* { *servat*.
lupus } { *naturitur* } { *vasiat*.

CONCORDIA, a town of Italy, in the duchy of Mirandola; seated on the river Secchia, 5 miles west of Mirandola, and 15 miles south-east of Mantua; subject to the house of Austria. E. Long. 11. 22. N. Lat. 44. 52.

CONCORDIA, a Pagan divinity of the Romans. She had a temple on the declivity of the capitol; another in the portico of Livia; and a third on Mount Palatine, built of brass by Cn. Flavius, on account of a vow made for reconciling the senate and people. She was pictured with a cup in her right hand; in her left was sometimes a sceptre, and sometimes a cornucopia. Her symbols were two hands joined, as is seen in a coin of Aurelius Venus, and another of Nero; also two serpents twisting about a caduceus.

CONCOU, in botany, a name given by the people of Guinea to an herb, which is in great esteem among them for killing that troublesome sort of worm called the *Guinea-worm*, that breeds in their flesh. They bruise the leaves, and mixing them with oil, apply them in form of a cataplasm.

CONCRETE, in the school-philosophy, an assemblage or compound.

CONCRETE, in natural philosophy and chemistry, signifies a body made up of different principles, or any mixed body: thus, soap is a factitious concrete, mixed together by art; and antimony is a natural concrete, or a mixed body compounded in the bowels of the earth.

CONCRETION, the uniting several small particles of a natural body into sensible masses, or concretes, whereby it becomes so and so figured and determined, and is endued with such and such properties.

CONCRETION is also the act whereby soft bodies are rendered hard; or an insensible motion of the

particles of a fluid or soft body, whereby they come to a confluence. It is indifferently used for induration, condensation, congelation, and coagulation.

CONCUBINAGE, denotes sometimes a criminal or prohibited commerce between the two sexes; in which sense it comprehends adultery, incest, and simple fornication: but, in a more limited sense, it signifies the cohabitation of a man and woman in the way of marriage, without having passed the ceremony thereof.

CONCUBINE, a woman whom a man takes to cohabit with after the manner of a wife, without being authorized thereto by a legal marriage.

CONCUPISCENCE, according to divines, an irregular appetite, or lust after carnal things, inherent in the nature of man ever since the fall.

CONDE (Lewis de Bourbon prince of), was born at Paris Sept. 7. 1621. He was styled Duke d'Enguien, till he succeeded to the title of Prince of Conde by his father's death in 1646. As he was of a tender and delicate constitution, the prince sent him to the castle of Montfond in Berry, that he might breathe a more pure and salutary air. Here he was educated in his infancy by some experienced and prudent citizens wives. When he was of a proper age, the prince took upon himself the task of governor, and appointed for his assistant M. de la Bouffieres, a private gentleman, a man of honour, fidelity, and good nature, and who made it a rule to observe inviolably the orders that were given him. Two Jesuits distinguished for their genius and knowledge were also given him for preceptors. He formed him a household of 15 or 20 officers, all men of the greatest virtue and discretion.

With these attendants the duke d'Enguien went to settle at Bourges, where he frequented the college of Jesuits. Here, besides the ordinary studies, he was taught ancient and modern history, mathematics, geography, declamation; also riding and dancing, in which last he soon excelled. He made such a surprising progress, that before the age of 13 he defended in public some questions in philosophy with incredible applause. At his return from Montfond, he had for his tutor M. de Merille; a man deeply versed in the knowledge of common law, of ancient and modern laws, of the holy scriptures, and of the mathematics. Under his direction the duke went through that new course with prodigious success. He acquired a critical taste in the arts and sciences, which he retained all his life; he never suffered a day to pass without dedicating two or three hours at least to reading; his thirst for knowledge was universal, and he endeavoured to search every thing to the bottom. His chief inclination, however, lay towards the military art; and at the age of 18 he obtained permission to make his first campaign as a volunteer in the army commanded by M. de la Meilleraye. This campaign was unfortunate; and the duke d'Enguien was only a witness of the marshal's imprudence and disgrace. Nevertheless, in this campaign he laid the foundation of that renown which made him after-wards considered as the greatest general of his age.

On his return to Paris, the duke waited upon cardinal Richelieu at Ruel. That minister was so pleased with

with his conversation, that he soon after made proposals of an alliance with the prince of Conde, by marrying the duke d'Enguien to Claire Clemence de Maille Broza, the cardinal's niece. The duke consented to this match out of obedience to his father; but the force he put upon himself by yielding to it was so great, that he fell dangerously ill. It was long before he got the better of his distemper; but at length he not only recovered, but became so strong as afterwards to bear the greatest fatigues with ease.

The duke made two more campaigns as a volunteer; the one under the marshal de la Meilleraye, the other in the army of Lewis XIII. which conquered Rouffillon. In 1643, at the age of 22, he obtained from the king, at the persuasion of cardinal Mazarine, the command of the army destined to cover Champagne and Picardy; which command was confirmed to him after the king's death by the queen regent, Anne of Austria, to whose interest he was strongly devoted. In this station, though he never had been present at any battle, he soon gave such a specimen of his abilities as crowned him with glory. The Spaniards who threatened France with an invasion, were defeated by him at Rocroi; and this signal victory made him from that time considered as the guardian genius of his country. He next formed the project of besieging Theonville, and proposed it to the council of regency. They consented with fear and distrust; but the duke carried it into execution with such skill, activity, and courage, that he became justly the subject of general admiration. In two months time Theonville surrendered. At length, having covered Alsace and Lorraine from the enterprises of the Imperialists, the duke returned to Paris, where he obtained the government of Champagne, and of the city of Stenai.

The three following years were little more than a series of military operations. The three battles of Fribourg, in which the duke d'Enguien triumphed over Velt Marhal count de Mercy, the greatest general in all Germany; the taking of Philippsbourg, and a great number of other places, which rendered him master of the palatinate, and of the whole course of the Rhine; the victory of Nortlingue, by which he revenged the viscount du Turenne's defeat at Mariendal; the siege and conquest of Dunkirk; the good and bad success of his arms in Catalonia, where, though he was forced to raise the siege of Lorida, he kept the Spaniards in awe, and cut to pieces their rear guard: these are the principal events which distinguish the campaigns of 1644, 1645, and 1646.

The victories of the duke d'Enguien, his great reputation and esteem with the people, began now to give umbrage to Mazarin. The cardinal's dislike to him appeared on the death of the duke de Breze, admiral of France. The prince of Conde earnestly demanded for his son the duke de Breze's places. But Mazarin, afraid of increasing the wealth and power of a prince whom his victories and the love and confidence of the people and the army had already rendered too formidable to him, evaded his request, by persuading the queen to take the admiralty to herself. On the death of his father, the minister's dislike to the young prince of Conde became still more apparent.

By the minister's persuasion he had accepted of the command of the army in Catalonia; but, on his arrival at Barcelona, he found neither troops, money, artillery, provisions, nor ammunition. Enraged at this deception, he vented his resentment in bitter complaints and severe threats; but by the resources that he found in this dilemma, the prince added new lustre to his glory.

The campaign of 1648 was as glorious to Conde as those which preceded it had been. To disconcert at once the projects of the archduke Leopold, the prince resolved to attack him even in the heart of the Low Countries; and notwithstanding the considerable difficulties which he had to surmount, he besieged the important city of Ypres, and took it in sight of all the enemies' forces.

Notwithstanding this success, Conde saw himself at the point of experiencing the greatest reverse of fortune. His army was a prey to scarcity, to nakedness, contagious distempers, and desertion. For eight months it received no supply from the minister, but half a muster. Every thing was supplied by the prince himself; he lavished his money, and borrowed more to supply his troops. When it was represented to him that he was in danger of ruining himself by such an enormous expence, he replied, that "since he every day ventured his life for the service of his country, he could very well sacrifice his fortune to it. Let but the government exist, (added he), and I shall want for nothing."

The French army having been reinforced by 4000 of the troops of Weimar, Conde attacked the Spaniards advantageously encamped near Lens, and gained a complete victory over them, which disabled them from attempting any thing more, and even from supporting themselves. Afterwards he besieged Furnes, the garrison of which, 500 men, surrendered themselves prisoners of war. But the prince was wounded there in the trenches by a musket-shot above the right hip; and the contusion was so great, that he was forced to submit to several incisions.

The French court, animated with the victory at Lens, thought this a proper time to take vengeance on the factions which for some time had violently agitated the kingdom; and accordingly imprisoned Broussel and Blancmenil, two of the principal leaders of the country party. This vigorous proceeding, however, occasioned a general revolt. Two hundred thousand men took arms in Paris, barricaded the streets, invested the palais-royal, and demanded the prisoners. It was necessary to release them; but from that time the regal authority was annihilated; the queen was exposed to a thousand insults, and Mazarin dared no longer venture out of the palais-royal. In this embarrassment the queen recalled the prince of Conde, as the only one from whom she could hope for support. He retired to Ruel, whither the regent had gone with the young king and Mazarin. Anne of Austria proposed to him the reducing of Paris by force of arms; but he calmed the resentments of that princess; and instead of being accessory to her vengeance, he directed all his views to pacify the kingdom, and at length brought about an accommodation between the parties, who desired it with equal ardour. But
new

Conde.

new incidents soon rekindled the combustions. The treachery of Mazarin, and the artifices of the leaders of the country party, occasioned new cabals and fresh troubles. Conde was cared by the leaders of both parties; but at last, enraged at the arrogance of the malcontents, who every day formed new pretensions, he took part openly with the court, though he thought it ungrateful, and protected the minister, though he did not esteem him.

The royal family, the duke of Orleans, Conde, and Mazarin, left Paris privately in the night between the 5th and 6th of January 1649, and went to St Germain. The parliament sent deputies to learn from the queen herself the reasons of her departure, and to beg her to name the citizens whom she suspected, that they might be tried. Mazarin had the imprudence to dismiss them without any answer. Exasperated at this, the people again took up arms in order to defend themselves against the enterprizes of the court, who had determined to block up and to starve the capital, in order to suppress the party of malcontents. With 7 or 8000 men, the broken relics of the last campaign, the prince of Conde formed a design of reducing above 500,000 intrenched behind walls. He had neither money nor magazines; he saw himself in the depth of a most severe winter; nevertheless he triumphed over Paris, and this great success completed his glory. It did him so much the more honour, as during the siege he constantly defeated the troops of the malcontents; he prevailed on the army that marched to their assistance under Turenne, to abandon that general; he stopped the progress of the duke de Longueville, who had caused an insurrection in Normandy; and got the start of the Spaniards, who were advancing to give him battle.

Conde de Retz, co-adjutor of Paris, and afterwards cardinal, was the life and soul of the revolvers, and directed all their motions. He had taken Catiline for his model; and was equally intrepid and capable of the greatest actions; of an exalted genius, but governed by his ambition. He distinguished his hatred to Mazarin by arming the malcontents; and he himself raised at his own expence a regiment which he called the regiment of *Corinth*: as soon as this corps took the field during the blockade of Paris, it was defeated and dispersed. This check was called "the first to the Corinthians." The peace was signed at St Germain; but neither party carried its point, and scarce any one but Conde acquired glory by this war. After the conclusion of the treaty, the prince repaired to the capital, and traversed all the streets in his coach alone. All persons of any consequence paid their compliments to him, and the parliament sent a solemn deputation to thank him for the peace to which he had so powerfully contributed. The people, however, made loud complaints on account of the king's absence (for the court was not yet returned to Paris), and the malcontents gave reason to apprehend a new insurrection. Conde encouraged the king and queen to return; and at length brought them to Paris, amidst the acclamations and blessings of the public.

The important service which Conde had just done the court intitled him to the acknowledgements of the queen, and especially of Mazarin; but the dark foul

of that cardinal only remembered it to punish a too fortunate and too powerful protector. He privately swore the prince's destruction; at least that he should give the whole kingdom a pattern of submission and dependence on his will. However, not to excite the public indignation, he still kept up appearances with the prince, while he secretly spread about him disgusts, suspicions, snares of every kind, and the most heinous calumnies. The ungrateful minister deceived the prince by making him the most flattering proposals; and with the most alluring promises which he always found means to avoid fulfilling. The enraged prince despised the minister, and treated him with disdain. After this they were reconciled again only to be again at variance. Each of them in their turn courted the country party, in order to make it subservient to their designs. At last Mazarin thought of an expedient, which but too effectually answered his purpose, of making an irreconcilable quarrel between that party and the prince. There was among the malcontents, one marquis de la Boulaie, a man of an infamous character, who had obtained the confidence of the party by false appearances of hatred to the cardinal, but who secretly kept up a correspondence with him. It is pretended that he made him an offer of privately killing Conde. Mazarin was charmed with the proposal; yet he only required Boulaie to exhibit all the proofs of an assassination, and to act in such a manner that every thing might concur to render the country party suspected of that crime. He was punctually obeyed; the coach was stopped; some pistols were fired at it, by which two of the footmen were dangerously wounded; and, after that shameful exploit, la Boulaie took refuge in the hotel of the duke of Beaufort, who was the hero of the party, in order no doubt to countenance the prince's suspicion of the malcontents. Luckily, Conde was not in his coach when it was stopped; the cardinal had spread the report of his intended assassination; and in concert with the queen and the prince he had prevailed to have the coach sent away empty, to prove the reality of the attempt. Mazarin counterfeited a zeal for the prince's life; he furiously declaimed against the malcontents, who, he pretended, had made an attempt on a life so precious to the state; and he inflamed Conde's resentment against the duke of Beaufort and the coadjutor, whom he supposed to be the authors of this heinous outrage. The prince was so strongly prejudiced, that he refused to hear them when they appeared before him to justify themselves. He demanded justice against them of the king; he formally accused them before the parliament, and remained inflexible in spite of the pains which the leaders of the party took to demonstrate to him that he had been imposed upon. However, the affair was brought before the parliament; the accused defended themselves, and the coadjutor, who had discovered the cardinal's secret, unmasked him so well, that the prince agreed to a private negotiation with the malcontents; he required nothing more than the coadjutor's leaving Paris, but with the rank of ambassador to Rome or Vienna. That prelate would have consented to it, to satisfy Conde, if Mazarin, some days after, had not given him the choice of any recompence, in order to engage

Conde.

his

his concurrence in the prince's destruction. Affairs were now in such a dangerous situation, that the cardinal saw clearly it was necessary to hasten to the winding up of the plot. Master of the queen's mind, which he guided as he pleased; and sure of having inflamed against Conde, all the resentment of the malcontents; he fought and obtained, by means of the duchess Chevreuse, the support of that powerful faction, which connected itself the more readily with him, in hopes that the prince's fall would soon enable it to crush without difficulty the cardinal himself. The coadjutor had private conferences with the queen, and the minister. Conde had notice of it; and in order to discover if it were true, he endeavoured to surpise it from Mazarin's own mouth. "Cardinal, (said he, one day), it is publicly reported that you have nightly meetings with the coadjutor, disguised like a trooper." He accompanied this speech with a quick and penetrating look; but the cardinal, who was a perfect master of dissimulation, answered him in such a free, artless like manner, that he entirely removed Conde's apprehensions; and he slighted the information he had received, of the plot forming against him.

Mazarin wanted nothing but the support of the duke of Orleans; and at last found means, by the duchess of Chevreuse, to enflame the jealousy of that fickle and inconstant prince, and to engage him to consent to the imprisonment of Conde. Having thus united all parties, and fearing no other obstacle, this ungrateful and perfidious minister made preparations for privately arresting the prince; the order for it was signed January 18th 1650. Conde having that day repaired as usual to the palais-royal, to assist at council with the prince of Conti and the duke of Longueville, the queen gave orders to arrest them all three, and convey them without any noise to the castle of Vincennes. She was instantly obeyed, and the princes were strictly guarded in that prison.

In this unexpected reverse of fortune, the fortitude and greatness of Conde's mind appeared only the more remarkable. Confined with the other two princes in the tower of Vincennes, where neither supper, furniture, nor beds were provided, he contented himself with two new laid eggs, and threw himself in his cloaths, on a truss of straw, where he slept 12 hours without waking. He still retained his cheerfulness, and dedicated the greatest part of his time to reading, the rest to conversation, playing at battle-door and shuttlecock, to bodily exercises, and the cultivation of flowers.

Mazarin triumphed at the disgrace of the princes, proscribed all those who were attached to Conde, and behaved in the most insolent and arbitrary manner. The prince's friends, however, notwithstanding their being strictly watched, found means to keep up a punctual correspondence with him. They made various attempts to release him: they raised troops; in particular, the dukes of Bouillon and Rochefoucault, and the viscount de Turenne. The princes of Conde engaged the province of Guienne to declare in his favour; she made war, in order to force the court to release him; at length the partisans of the prince signed a treaty with the Spaniards, to labour in concert for his enlargement. But all these efforts would, perhaps, have

been ineffectual, if other more powerful resources had not been employed.

In that gallant and warlike age, every thing was managed by the passions and intrigues of five or six women, who possessed the confidence of the leaders of the state, and of the various parties. The princess of Mantua, wife to one of the sons of the elector Palatine, king of Bohemia, principally directed the counsels in the party of the princes. She found means to reconcile the duke of Orleans, the coadjutor, and the malcontents with the friends of the prince, and united their efforts against the cardinal. The parliament, on the other side, loudly demanded the release of the prisoners. All the orders of the state united in soliciting it, inasmuch that the queen was at last prevailed on to give her consent. At this news, Mazarin was so confounded, that he fled in the disguise of a trooper, and arrived at the gates of Richlieu, where a body of horse waited for him. The parliament, informed by the queen of his flight, thundered forth an *arret*, by which he was obliged to leave the kingdom, with his family and foreign servants, in the space of 15 days, under the penalty of being exposed to a criminal prosecution. The queen desired to follow him with the king; but the nobles and burghers invested the palais-royal, and prevented the execution of this project, which would have kindled a civil war. Mazarin, therefore, perceiving that it was impossible for the queen to join him, determined to get himself to restore the princes to their liberty, and to go the start of the deputies who were coming to acquaint them with it. On his arrival at Havre, he informed the princes that they were free; he entreated Conde's friendship; and was so abject as to prostrate himself at the feet of him whom he had so basely oppressed. Conde gave him a polite reception, and spoke to him in a free and cheerful tone; but tired with the mean submissions which the cardinal lavished upon him, he left him without making any promise, and set out on his return to Paris, which he entered as it were in triumph, amidst the acclamations of all orders of men, and the demonstrations of a most sincere and general joy.

After this a civil war ensued, in which the prince of Conde sided with the malcontents. Being pressed by the king's army, he retired into the suburbs of St Anthony, where he behaved with the utmost bravery; when the citizens opened their gates and received him in; and a peace ensued soon after. His hatred of the cardinal, however, made him quit Paris, and take refuge among the Spaniards, who made him generalissimo of their forces; and he took Rocroi. The peace of the Pyrenees restored him to his country; and he again signalized himself at the head of the king's armies. Being afflicted with the gout he refused the command of the army in 1676, and retired to Chartilly, where he was as much esteemed for the virtues of peace, as he had been before for his military ones. He died in 1686, at Fontainebleau.

CONDE, a town of the French Netherlands, in the province of Hainault, with the title of a principality, and a castle. It is one of the strongest towns in this country, and seated near the confluence of the rivers Haine and Scheld. E. Long. 3. 29. N. Lat. 50. 27.

CONDE, a town of France, in Normandy, and in the

Condemnation the Bessin, which carries on a considerable trade; seated on the river Nereau. W. Long. o. 37. N. Lat. 48. 50.

Conditional

CONDEMNATION, the act of giving judgment, passing or pronouncing sentence against a person subjected thereby to some penalty or punishment, either in respect of life, reputation, or fortune.

CONDENSATION, the act whereby a body is rendered more dense, compact, and heavy. The word is commonly applied to the conversion of vapour into water, by distillation, or naturally in the clouds. The way in which vapour commonly condenses, is by the application of some cold substance. On touching it, the vapour parts with its heat which it had before absorbed; and on doing so, it immediately loses the proper characteristics of vapour, and becomes water. But though this is the most common and usual way in which we observe vapour to be condensed, nature certainly proceeds after another method: since we often observe the vapours most plentifully condensed when the weather is really warmer than at other times. See the articles *CLOUD*, *EXPANSION*, *EVAPORATION*, *VAPOUR*, &c.

CONDENSER, a pneumatic engine, or syringe, whereby an uncommon quantity of air may be crowded into a given space; so that sometimes ten atmospheres, or ten times as much air as there is at the same time, in the same space, without the engine, may be thrown in by means of it, and its egress prevented by valves properly disposed. See plate LXXIV.

It consists of a brass cylinder, wherein is a moveable piston; which being drawn out, the air rushes into the cylinder through a hole provided on purpose; and when the piston is again forced into the cylinder, the air is driven into the receiver through an orifice, furnished with a valve to hinder its getting out.

The receiver or vessel containing the condensed air, should be made very strong, to bear the force of the air's spring thus increased; for which reason they are generally made of brass: its orifice is fitted with a female screw to receive the male screw at the end of the condenser.

If glass be used for a condenser, it will not suffer so great a degree of condensation; but the experiment will be more entertaining, since the subject may be viewed in the condensed air.

CONDITION, in the civil law, a clause of obligation stipulated as an article of a treaty or a contract; or in a donation of a testament, legacy, &c. in which last case a donee does not lose his donative if it be charged with any dishonest or impossible conditions.

CONDITIONAL, something not absolute, but subject to conditions.

CONDITIONAL Conjunctions, in grammar, are those which serve to make propositions conditional; as *if*, *unless*, *provided*, &c.

CONDITIONAL Propositions, in logic, such as consist of two parts connected together by a conditional particle.

CONDITIONAL Syllogism, a syllogism where the major is a conditional proposition. Thus,

If there is a God he ought to be worshipped.

But there is a God;

Therefore he ought to be worshipped.

The Arminian divines maintain that all the decrees of God relating to the salvation and damnation of man are truly conditional; and the Calvinists, that they are absolute.

CONDOM, a town of Gascony in France, capital of the Condomois, with a bishop's see. It is but a poor place, and the trade is very small. It is seated on the river Gelisse, in E. Long. o. 22. N. Lat. 44.

CONDOR, or **CONTOR**, in ornithology. See *VULTUR*.

CONDOMIENTES, in church-history, religious sectaries, who take their name from lying all together, men and women, young and old. They arose in the 13th century, near Cologne; where they are said to have worshipped an image of Lucifer, and to have received answers and oracles from him.

CONDRIEU, a town of Lyonnais in France, remarkable for its excellent wines. It is seated at the foot of a hill near the river Rhone, E. Long. 4. 33. N. Lat. 45. 28.

CONDUCTOR, in surgery, an instrument which serves to conduct the knife in the operation of cutting for the stone, and in laying up sinules and fistulas.

CONDUCTORS, in electrical experiments, are those bodies that receive and communicate electricity; and those that repel it are called *non-conductors*.

CONDUIT, a canal or pipe for the conveyance of water, or other fluid.

There are several subterraneous conduits through which the waters pass that form springs. Artificial conduits for water are made of lead, stone, cast-iron, potter's earth, timber, &c.

CONDYLOID and **CORONOID Processes**. See *ANATOMY*, n^o 25. b.

CONDYLOMA, in medicine, a tubercle, or callous eminence which arises in the folds of the anus, or rather a swelling or hardening of the wrinkles of that part.

CONDYLUS, a name given by anatomists to a knot in any of the joints, formed by the epiphyfis of a bone.

CONE, in geometry, a solid figure, having a circle for its base, and its top terminated in a point or vertex. See *CONIC SECTIONS*.

Melting CONE, in chemistry, is a hollow cone formed of copper or brass, with a handle, and with a flat bottom adjoining to the apex of the cone, upon which it is intended to rest. Its use is to receive a mass of one or more metals melted together, and cast into it. This mass, when cold, may be easily thook out of the vessel, from its figure. Also, if a melted mass consisting of two or more metals, or other substances not combined together, be poured into this vessel, the conical figure facilitates the separation of these substances according to their respective densities. The cone ought to be well heated before the melted mass is thrown into it; that it may not contain any moisture, which would occasion a dangerous explosion. It ought also to be greased internally with tallow, to prevent the adhesion of the fluid matter.

CONE of Rays, in optics, includes all the several rays which fall from any radiant point upon the surface of a glass.

CONE, in botany. See *CONUS*.

CONESSI,

Condom
Cone.

Confessi
Confession.

CONESSI, a sort of bark of a tree, which grows on the Coromandel coast in the East Indies. It is recommended in a letter to Dr Monro, in the Medical Effays, as a specific in diarrhæas. It is to be finely pulverized, and made into an electuary with syrup of oranges. The bark should be fresh, and the electuary new made every day, or second day, otherwise it loses its astringent but grateful bitterness on the palate, and its proper effects on the intestines.

CONFECTION, in pharmacy, signifies, in general, any thing prepared with sugar: in particular it imports something preserved, especially dry substances. It also signifies a liquid or soft electuary, of which there are various sorts directed in dispensaries. See PHARMACY, n^o 883.

CONFECTS, a denomination given to fruits, flowers, herbs, roots, &c. when boiled or prepared with sugar or honey, to dispose them to keep, and render them more agreeable to the taste.

CONFEDERACY, in law, is when two or more persons combine to do any damage to another, or to commit any unlawful act. Confederacy is punishable, though nothing be put in execution; but then it must have these four incidents: 1. That it be declared by some matter of profecution, as by making of bonds or promises to one another; 2. That it be malicious, as for unjust revenge; 3. That it be false, *i. e.* against the innocent; and, lastly, That it be out of court, voluntary.

CONFERVA, RIVER-WEED; a genus of the order of algae, belonging to the cryptogamia class of plants. There are 21 species, most of them growing on stones in slow streams, on the sides of cisterns, or in ponds.

CONFESSION, in a civil sense, a declaration or acknowledgement of some truth, though against the interest of the party who makes it; whether it be in a court of justice, or out of it. It is a maxim, that in civil matters, the confession is never to be divided, but always taken entire. A criminal is never condemned on his simple confession, without other collateral proofs; nor is a voluntary extrajudicial confession admitted as any proof. A person is not admitted to accuse himself, according to that rule in law, *Non auditur perire volens*. See ARRAIGNMENT.

CONFESSION, among divines, the verbal acknowledgement which a Christian makes of his sins.

Among the Jews it was the custom, on the annual feast of expiation, for the high-priest to make confession of sins to God in the name of the whole people: besides this general confession, the Jews were enjoined, if their sins were a breach of the first table of the law, to make confession of them to God; but violations of the second table were to be acknowledged to their brethren. The confession of the primitive Christians were all voluntary, and not imposed on them by any laws of the church; yet private confession was not only allowed, but encouraged.

The Romish church requires confession not only as a duty, but has advanced it to the dignity of a sacrament: this confession is made to the priest, and is private and auricular; and the priest is not to reveal them under pain of the highest punishment.

CONFESSION of Faith, a list of the several articles of belief in any church.

Confessi-
onal
Confag-
ration.

CONFSSIONAL, or CONFESSORY, a place in churches under the great altar, where the bodies of deceased saints, martyrs and confessors, were deposited.

This word is also used by the Romanists for a desk in the church where the confessor takes the confessions of the penitents.

CONFESSOR, in the Romish church, a priest who is empowered to receive the confession of penitents, and to give them absolution.

CONFIGURATION, the outward figure which bounds bodies, and gives them their external appearance; being that which, in a great measure, constitutes the specific difference between bodies.

CONFIRMATION, in a general sense, the act of ratifying or rendering a title, claim, report, or the like, more sure and indisputable.

CONFIRMATION, in law, a conveyance of an estate, or right in *esse*, from one man to another, whereby avoidable estate is made firm and unavoidable, or a particular estate is increased, or a possession made perfect.

CONFIRMATION, in theology, the ceremony of laying on of hands, for the conveyance of the Holy Ghost.

The antiquity of this ceremony is, by all ancient writers, carried as high as the apostles, and founded upon their example and practice. In the primitive church, it used to be given to Christians immediately after baptism, if the bishop happened to be present at the solemnity. Among the Greeks, and throughout the East, it still accompanies baptism: but the Romanists make it distinct independent sacrament. Seven years is the stated time for confirmation: however, they are sometimes confirmed before, and sometimes after that age. The person to be confirmed has a god-father and god-mother appointed him, as in baptism. The order of confirmation in the church of England, does not determine the precise age of the persons to be confirmed.

CONFISCATION, in law, the adjudication of goods or effects to the public treasury; as the bodies and effects of criminals, traitors, &c.

CONFLAGRATION, the general burning of a city, or other considerable place.

This word is commonly applied to that grand period or catastrophe of our world, when the face of nature is to be changed by fire, as formerly it was by water. The ancient Pythagoreans, Platonists, Epicureans, and Stoics, appear to have had a notion of the conflagration: though whence they should derive it, unless from the sacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themselves had it from the Jews. Seneca says expressly, *Tempus advenit quo sidera sideribus incurant, et omni flagrante materia uno igne; quicquid nunc ex depositis, lucet, ardebit*. This general dissolution the Stoics call *καταστροφή, εκπύρωσις*. Mention of the conflagration is also made in the books of the Sibyls, Sophocles, Hyllaspes, Ovid, Lucan, &c. Dr Burnet, after F. Tachard and others, relates that the Siamese believe that the earth will at last be parched up with heat; the mountains melted down; the earth's whole surface reduced to a level, and then consumed with fire. And the Bramins of Siam do not only hold that the world shall be destroyed by fire; but also, that a

Confluent
Confucius.

new earth shall be made out of the cinders of the old. Various are the sentiments of authors on the subject of the conflagration; the cause whence it is to arise, and the effects it is to produce. Divines ordinarily account for it metaphysically; and will have it take its rise from a miracle, as a fire from heaven. Philosophers contend for its being produced from natural causes; and will have it effected according to the laws of mechanics. Some think an eruption of the central fire sufficient for the purpose; and add, that this may be occasioned several ways, *viz.* either by having its intention increased; which, again, may be effected either by being driven into less space by the encroachments of the superficial cold, or by an increase of the inflammability of the fuel whereon it is fed: or by having the resistance of the imprisoning earth weakened; which may happen, either from the diminution of its matter, by the consumption of its central parts, or by weakening the cohesion of the constituent parts of the mass by the excess of the defect of moisture. Others look for the cause of the conflagration in the atmosphere; and suppose, that some of the meteors there engendered in unusual quantities, and exploded with unusual vehemence, from the concurrence of various circumstances, may effect it, without seeking any further. The astrologers account for it from a conjunction of all the planets in the sign Cancer; as the deluge, say they, was occasioned by their conjunction in Capricorn. Lastly, others have recourse to a still more effectual and flaming machine, and conclude the world is to undergo its conflagration from the near approach of a comet in its return from the sun.

CONFLUENT, among physicians, &c. an appellation given to that kind of SMALL-POX wherein the pustules run into each other.

CONFORMATION, the particular consistence and texture of the parts of any body, and their disposition to compose a whole.

CONFORMATION, in medicine, that make and construction of the human body, which is peculiar to every individual.

Hence, a *mala conformatio* signifies some fault in the first rudiments; whereby a person comes into the world crooked, or with some of the viscera or cavities unduly framed or proportioned. Many are subject to incurable asthma's, from a too small capacity of the thorax, and the like vitiations conformations.

CONFORMITY, in the schools, is the congruency, or relation of agreement between one thing and another: as between the measure, and the thing measured; the object, and the understanding; the thing, and the divition thereof, &c.

CONFRONTATION, the act of bringing two persons in presence of each other, to discover the truth of some fact which they relate differently.

The word is chiefly used in criminal matters; where, the witnesses are confronted with the accused; the accused with one another, or the witnesses with one another.

CONFUCIUS, a Chinese philosopher, who lived about 500 years before our Saviour's birth, in the kingdom of Lu, now called the province of Xantung. His wit and judgment got him a reputation from his

very youth; and being a mandarin, and employed in the government of the kingdom of Lu, his profound knowledge of morals and politics made him be greatly admired. Notwithstanding his care, his prince's court was much disordered, and Confucius finding the king would not listen to his advice, quitted the court and taught moral philosophy with such applause that he soon had above 3000 scholars, whereof 72 surpassed the rest in learning and virtue, for whom the Chinese have still a particular veneration. He divided his doctrine into four parts, and his scholars into four classes: the 1st order was of those who studied to acquire virtue; the 2^d, those who learned the art of reasoning well; the 3^d studied the government of the state, and the duty of magistrates; the 4th were wholly taken up in noble discourses of all that concerned morals. In spite of all his pains to establish pure morality and religion, he was nevertheless the innocent cause of their corruption. It is said, that when he was complimented upon the excellency of his philosophy, he replied, that he felt greatly short of the perfect degree of virtue; but that in the west, the most holy was to be found. This made a strong impression on the learned; and in the 66th year after Christ's birth, the emperor Mun-ti sent ambassadors toward the west to seek this holy man. They stopped at an island near the Red-sea, and found a famous idol named Fohi, representing a philosopher that lived 500 years before Confucius. They carried this idol back with them, with instructions concerning the worship rendered to it; and so introduced a superstition that abolished in several places the maxims of Confucius. His tomb is in the academy where he taught, near the town Xio-fu, upon the banks of the river Xu. This philosopher has been in great veneration in China above 2000 years; and is still so esteemed, that each town has a palace consecrated to his memory. There was one of his descendants who was very considerable in the kingdom in 1646, whom Xanchi king of Tartary, who then conquered China, received with a great deal of honour. All those of his family are mandarins by birth; and have a privilege common with the princes of the blood, not to pay any tribute.

CONFUSION, in a general sense, is opposed to order; in a perturbation whereof, confusion consists: *e. gr.* when things prior in nature do not precede; or posterior do not follow, &c.

In a logical sense, confusion is opposed to distinctness, or perspicuity; and may happen, either in words, as when misconstrued or misapplied; or in ideas, as when the idea of any thing presents something along with it, which does not properly belong to that thing. See IDEA, and NOTION.

In a physical sense, confusion is a sort of union or mixture by mere contiguity.—Such is that between fluids of contrary nature, as oil and vinegar, &c.

CONFUSION, in Scots law, is a method of suspending and extinguishing obligations. See LAW, Part III. N^o clxxxvi. 8.

CONFUSION of Tongues. By this phrase is generally understood that miraculous interposition of the Deity mentioned in the book of Genesis, to cause mankind desist from their attempt to build the tower of Babel, and

Confucius
Confusion.

Confusion. and to makè them separate, and divide themselves into different nations.

It hath been much disputed whether there were more languages than one before the flood; and many arguments have been adduced by learned men on both sides. This question, however, it is easy to see, can never be determined; but whether it was so or not, it is plain there must have been but one for some time after the flood, as all mankind were descended from one family. As to the confusion of tongues and dispersion of mankind, it is an event mentioned by profane as well as the sacred historians*. They write that mankind used one and the same language till the overthrow of the tower of Babylon; at which time a multiplicity of tongues was introduced by the gods; whereupon wars ensued, and those whose speech happened to be intelligible to one another, joined company, and seized the countries they chanced to light upon.

* Universal History, Vol. I. p. 347.

With regard to the manner, however, in which this confusion was effected, there is a great variety of sentiments. Several learned men, prepossessed with an opinion that all the different idioms now in the world did at first arise from one primitive language to which they may be reduced, and that the variety which we find among them is no other than what must naturally have taken place in so long course of time, have thence been induced to believe that there were no new languages formed at the confusion, but that the most that was done at that time was only to set the builders of Babel at variance with one another by creating a misunderstanding among them. This some imagine to have been effected without any immediate influence on their language; which seems contrary to the words and obvious intention of the sacred historian. Others have imagined it brought about by a temporary confusion of their speech, or rather of their apprehensions, causing them, while they continued together, and spake the same language, yet to understand the words differently. A third opinion is, that a variety of inflexions was introduced, and perhaps some new words, which disturbed and perverted the former manner of expression. But this, though it might occasion different dialects, yet could not create new languages; and seems not to answer the intention of Moses, which was to inform us not only how mankind were at first dispersed into so many nations, but to account for their different languages; a thing very difficult if not impossible to be done, without having recourse to the immediate interpolation of divine power. For though time, intercourse with foreign nations, commerce, the invention and improvement of arts and sciences, and the difference of climates, cause very considerable alterations in languages; yet the utmost effect we can imagine them to have will not come up to the point in question. Upon the whole, therefore, it seems most probable, that on the confusion at Babel there were new languages formed; and that these languages were the roots of all others that are, that have been, or that will be spoken while the world remains.

In what manner these new languages were formed, is a matter not easy to be determined. From the manner in which this event is related by Moses, some

have concluded that God effected it by immediately inducing an oblivion of their former tongue, and instantaneously infusing others into their minds. The Jews imagined this to be done by the ministry of angels, 70 of whom descended with God, and were each of them set over a nation, to whom they taught a peculiar language; but that the ancestors of the Jewish nation retained the primitive language. Others have supposed, that God did no more than cause them to forget their old language, leaving them to form new ones in the best manner they could; but this must have taken up some time, and could but ill have answered the necessities of mankind; and the way in which Moses expresses himself seems to imply that it was done instantaneously.

As to the number of different languages formed at this time, we are no less in the dark than as to the manner in which they were formed. It is most probable, that the languages of the chief families were fundamentally different from each other, and that the sub-languages or dialects within each branch, for the sake of immediate intercourse, had a mutual affinity, some more, and some less, according as they settled nearer or farther from each other; which was sufficient to bring about the designs of God, divide mankind into distinct societies, and open a new scene of Providence, by which his wisdom might display itself in the government of the world.

CONGE', in the French law, a licence, or permission, granted by a superior to an inferior, which gives him a dispensation from some duty to which he was before obliged. A woman cannot obligate herself without the *conge* or licence of her husband; a monk cannot go out of his convent, without the *conge* of his superiors.

CONGE' d'*lire*, in ecclesiastical polity, the king's permission royal to a dean and chapter in the time of a vacancy, to chuse a bishop; or to an abbey, or priory, of his own foundation, to chuse their abbot or prior.

The king of England, as sovereign patron of all archbishops, bishops, and other ecclesiastical benefices, had of ancient time free appointment of all ecclesiastical dignities, whensoever they chanced to be void; investing them first *per baculum & annulum*, and afterwards by his letters-patent; and in course of time he made the election over to others, under certain forms and limitations, as that they should at every vacation, before they chuse, demand the king's *conge d'*lire**, and after the election crave his royal assent, &c.

CONGE', in architecture, a mould in form of a quarter round, or a cavetto which serves to separate two members from one another; such as that which joins the shaft of the column to the cincture, called also *apophyse*.

CONGES are also rings or ferrels formerly used in the extremities of wooden pillars, to keep them from splitting, afterwards imitated in stone-work.

CONGELATION, or FREEZING, is a term used to denote the transition of certain substances from a fluid to a solid form. Though equally applicable to the hardening of melted metals, it is seldom used in this case; as their consolidation, though attended with a

Conge'
Congela-
tion.

Congela-
tion.

certain degree of cold, yet leaves them possessed of an intense heat; and therefore, the term which is used to express the hardening of water, &c. which is attended with a very great degree of sensible cold, seems not so proper in common language.

I
Different
degrees of
cold required
to freeze dif-
ferent li-
quors.

Various degrees of cold are required for the congelation of different fluids. Water congeals when Fahrenheit's thermometer stands at 32° above 0; vinegar, when it sinks to 27° ; wine, when it sinks to 20° ; but brandy cannot be frozen till it has sunk to 7° below 0, and weak spirit of wine does not consolidate till it has sunk to 33° . Mercury requires a still greater degree of cold, such as in this country we can have no conception of. In fact, this substance having been found to retain its fluidity under the greatest degrees of cold, known not only in this country, but in every other, it was till very lately considered as essentially fluid.

2
Quickfil-
ver frozen.

Mr Brawn, however, at Petersburg, where very severe frosts are often felt, thought of making an experiment how far the quicksilver in the thermometer might be made to sink, by plunging it into a freezing mixture, while the cold was at its most extreme degree in that rigorous climate. Accordingly, one day while the frost was so intense that the thermometer stood at 40° below 0, he plunged it into a mixture of snow and spirit of nitre; upon which the quicksilver descended to 352° , and then became stationary. Upon removing the thermometer into a warm room, he observed, that it remained there 12 minutes before it began to rise; which made him suspect that the mercury had actually been frozen. To be convinced whether or not this was the case, he repeated the experiment, and when the quicksilver had again become stationary, he broke the glass, and found that it had really assumed a solid form, was perfectly flexible, and bore several strokes of a hammer.

In making this experiment he remarked, that the quicksilver descended regularly to 148° , after which it remained stationary for a little, and then would suddenly descend 100° at once. From this Dr Black conjectures, that 148° below 0 is the freezing point of quicksilver. The subsequent irregular descent of the mercury he attributes to the contraction of the solid metal in the act of congelation; for after it had descended this length, it would suddenly descend by starts, a great number of degrees at once. In this he is the more confirmed, that Mr Brawn had one thermometer, the quicksilver of which did not become solid; notwithstanding which, it would not descend below 148° .

3
Phenomena
exhibited
by water
during its
congelati-
on.

Though every known substance, and water as well as others, suffers a remarkable diminution in bulk on being exposed to a cold air; yet after water is arrived at the freezing point, the consolidation which then instantly takes place in some part of it, makes it suddenly expand about $\frac{1}{4}$ of its original bulk; which expansion is found to be owing to an innumerable quantity of small bubbles with which the ice is filled. On thawing a piece of ice under an exhausted receiver, these bubbles rise to the top of the liquid, and then break; but do not affect the mercurial gage of the air-pump in the least. What is more remarkable, though water will freeze when the thermometer sinks as low as 32° , yet if it is suffered to remain absolutely at rest,

it may be cooled to a considerable degree below this: but the moment it is touched or shaken, part of it is converted into ice; and what is still more strange, it now becomes warmer than before, the thermometer rising immediately to 32° degrees.

The action of congelation is always instantaneous, and appears very similar to the crystallization of salts. It is greatly promoted by plunging the liquor to be frozen into a mixture of snow and salt, spirit of nitre, or marine acid, and salt, &c.; and no substances have been found to retain their fluidity when exposed to the intense cold produced by these mixtures, except spirit of wine in its strongest state, ether, and the bituminous oil called *naphtha*. (See COLD.)

Concerning the manner in which the congelation of water is produced, there have been various suppositions; some reckoning it to be occasioned merely by the deprivation of a certain quantity of sensible heat; others by the introduction of some extraneous matter, which they distinguished by the name of *frigorific particles*, and supposed them to be of a saline, acid, or nitrous nature.

This last hypothesis hath been adopted by Mr Muschenbroek; who is of opinion that these particles insinuate themselves between the parts of the water, and thus stop their motion, by which means the water loses its fluidity. His reasons are as follow.

1. All bodies contract, or are condensed, on becoming solid: but water, when frozen, is expanded to about $\frac{1}{4}$ of its bulk; which shews that something extraneous has been introduced into it.

2. It hath been observed by Reaumur in France, Huxham at Plymouth, &c. that the thermometer would sometimes stand at 36° all the time of a severe frost.

3. He has observed flowers of steel when the thermometer stood at 30° ; which indicates the existence of frigorific particles in the air; and which being attracted by the water contained in it, froze the vapour.

4. He has often seen hoar-frost upon vegetables, as trees and the leaves of plants, when no ice was to be seen upon lakes and ponds, by which he imagines the same attraction of frigorific particles to be shown.

5. He has often seen a frosty night in March, April, or even June, after a warm clear day, and a good breeze of wind. He could not see how this wind could so much cool the ground; he rather supposes that it brought frigorific particles along with it.

6. It has been observed to freeze hard in some parts, when there was but a little slight frost in others situated as far north.

7. Ice-water is extremely hard: he therefore supposes, that it contains some matter which communicates this hardness to it; and this he cannot imagine to be any thing else than the frigorific particles imbedded in the air, and by which it was frozen.

8. The quickness of the production of ice on stagnating water, is not in proportion to the coldness, as may be shown by a thermometer; so he supposes it must depend on some other circumstances.

9. Water may be made to retain its fluidity, though cooled below its ordinary freezing point, provided it is kept in perfect rest and tranquillity, and in a small vessel;

Congela-
tion.

4
Accounted
for by Mr
Muschen-
broek.

Congela-
tion.

vessel; but if it is disturbed in that state, it freezes instantly.

10. A wet cloth sometimes freezes when hung in the air, when there is no ice elsewhere. This does not always succeed; and when it does, Mr Muschenbroek thinks it depends on the preference, or the attraction, or congelation or frigorific particles.

11. If a mixture of salt and snow is put over a fire, and a bowl with some water placed in the middle of it; while the salt and snow are melted into a liquid, the water will be frozen into a mass of ice. This he considers as a plain proof that the fire drives the congelating particles from the mixture into the bowl that contains the water: and he thinks it very absurd that the congelation should depend merely on the diminution of heat; for how can the heat of the fire, by entering the snow, produce any diminution of heat in the water?

All these reasons are answered, and most of them very satisfactorily, by Dr Black. Indeed, if we except the 1st, the 9th, and the 11th, there is none of them from which any conclusion can reasonably be formed concerning the cause of congelation either by frigorific particles, or any thing else. Mr Muschenbroek's last reason is shewn by the doctor to be a mere juggle; for placing the apparatus on the fire is by no means conducive to the success of the experiment, but the contrary. The salt and snow would congeal the water, though kept at a distance from the fire; and the power of this mixture to produce cold is so great, that even the setting it over the fire does not hinder the water from being frozen.

The most puzzling circumstance attending the congelation of water, is its expansion. This, however, is now explained by Dr Black in a satisfactory manner, who proves that it is owing to an extrication of air from the water. His experiment in proof of this is, to freeze water in Florence flasks. The thinness of the glass of which those vessels are formed, gives them a degree of flexibility, by which they sometimes yield so much to the expansive power of water in the act of congelation, that a Florence flask full of water may be completely frozen without being broke. When this is the case, and the vessel is inverted, and set in a warm place, the bubbles, to which the water owed its expansion when congealed, will ascend to the top, where they manifestly discover themselves to be air by forming one large bubble, which after some time is absorbed by the water. Their not affecting the mercurial gage of the air-pump, he thinks is owing to the small quantities of liquid that have been made use of in these experiments.

The doctor's theory, by which he accounts for the congelation of water, as well as the conversion of it into steam, is very ingenious and satisfactory. See EVAPORATION. He is of opinion, that all fluidity depends, not upon that quantity of heat contained in any substance which makes it sensibly warm to the touch, or by which it affects a thermometer, but on a certain quantity taken into the innost essence or composition of the body, so as to become an essential part of itself.

The easiest method of conceiving these two different states of the element of fire or heat, is by mixing

a quantity of powdered salts with water. For some time the salt will remain undissolved, and render the fluid opaque when shaken. In that state it represents sensible heat, or the element of fire combined with the fluid in such a manner as to affect a thermometer, or to make it sensibly warm. When the salt is dissolved, the fluid then becomes transparent, and the salt invisible; so that it cannot be known by the eye, whether any salt exists there or not. In like manner, when the element of fire enters into the solid ice, so as to render it fluid, it becomes imperceptible to the touch, and only discovers itself by communicating a part of its own subtilty and fluidity to the ice.

That this actually is the case, he proves from its being possible to cool water below the freezing point, provided it is suffered to remain at rest; and from its raising the thermometer to 32°, immediately upon the congelation taking place. Indeed the sudden increase of heat cannot be accounted for on any other supposition whatever. The water having more of its sensible heat carried off than is sufficient to keep the latent heat from breaking out, it instantly leaves some part of the water wherewith it was conjoined, and heats the whole to a certain degree.

From some experiments made by Dr Black, mentioned in a letter from him to Sir John Pringle, and published in the Philosophical Transactions, water is shewn to freeze sooner after it has been boiled than when it has not. The difference, however, he supposes to consist in this, that the unboiled water may be cooled down to a few degrees below the freezing point without losing its fluidity, provided it is suffered to remain perfectly at rest; but the unboiled water begins to freeze as soon as it is cooled down to 32°. If unboiled water, however, is kept continually stirring, he thinks it would begin to freeze full as soon: for though a considerable quantity of ice was formed on the boiled water, while the other remained perfectly fluid; yet, upon stirring the latter, it immediately froze, and the ice was formed on it in as great quantity as the former.

The reason of this difference appears to the doctor to be as follows. The congelation of common water is hastened by disturbing it; and as in boiling water the air is expelled from it, (see AIR), it begins to imbibe the air which it has lost, as soon as it is exposed to it. By this absorption the boiled water is continually exposed to the action of a disturbing cause, viz. the entrance of the air into it, to which the other is not; and, therefore, it is impossible to make boiled water in the least colder than 32°, without some part of it being formed into ice. In this opinion he is confirmed by some experiments of Fahrenheit's; who having put some water purged of its air into little glass globes, and sealed them up, he was surprized to find them continue much longer unfrozen than he expected; but the moment they were opened, or the glass shaken in the least, the congelation took place.

The force with which ice expands in the act of congelation is prodigious. Huygens, in order to try it, filled a cannon, whose sides were an inch thick, with water; and then closed the mouth and touch-hole, so that none could escape. The instrument thus

Black.

Congela- tion.	C O N [2190]	C O N	Congela- tion.
	<p>filled was then exposed to a strong freezing air. In less than 12 hours the water was frozen, and expanded with such violence as to burst the piece in two different places. At Peterburgh, in the winter of 1749, an iron bomb was burst by water turned into ice. Various other attempts have been made to calculate the expansive force of ice. A strong cylindrical box of metal was filled with water, well purged of its air by boiling and the air-pump. Being then fitted exactly with a metalline cover, between which and the water a wet leather was interposed, it was strongly pressed down with four iron-screws. The box being then placed in a freezing mixture, the water was frozen into a solid mass in less than half an hour; and as its bulk increased, three of the screws were forced off by the violence of the pressure, and the cover was raised up on one side about a quarter of an inch above the rim. This experiment having proved ineffectual to determine the power of expansion by frost, it was repeated in a different form. The cover of the box, instead of being screwed down, was pressed upon by the shorter arm of a very strong lever, which was compounded with two others, in such a manner that when a weight of 28 lb. was hung on the extremity of the most remote lever, the short arm of the first pressed upon the cover of the box with a force equal to 2296 lb. The water in the box being then made to freeze, it overcame the whole strength of the machine. The Florentine academicians have been the only persons who succeeded in their endeavours to overcome this expansive power. Being desirous of knowing what degree of strength was requisite to overcome the expansive power of a spherule of ice one inch in diameter, they procured a hollow sphere of brass, the sides of which were an inch thick, which was exactly the diameter of the hollow within. Having filled this with water, and folded up the small hole by which it was introduced, they exposed it to the cold of a freezing mixture, but the globe did not burst. They then gave it to a turner, who pared off something from the thickens. Having again exposed it to the cold, it still continued whole; but, on paring it a second time, and then exposing it to the severe cold of a freezing mixture, it burst, notwithstanding it still continued so thick as to require a force (according to Mr Muschenbroek's calculation) of 27,720 pounds, near 14 tons, to tear it asunder: and, even here, a doubt may be suggested, whether the great thickens of the sides did not prevent the action of the freezing mixture from congealing the water contained in the globe, till it was pared down sufficiently to let the cold have an effect. It is also to be considered, that cold diminishes the toughness of metallic substances, rendering them much more brittle; and consequently the brass globe could not, when exposed to the cold of a freezing mixture, require so much force to burst it, as it would have done in a moderate warmth.</p>	<p>In general, the ice of northern countries is much harder than that of the more southern climates. The reason of this probably is, that though a great quantity of the latent heat is exhaled by such a degree of cold as is necessary to produce ice, yet it is not wholly so; in consequence of which, the ice still shows, by its softness, some disposition to fluidity, which gradually lessens as the cold exerts more of the latent heat; and the ice grows still harder by being more and more exposed to severe frost.</p>	<p>8 Hardness of ice in the northern countries.</p>
	<p>During the severe frost of 1740, a palace of ice was built at Peterburgh after the most elegant model, and the justest proportions of Augustan architecture. It was 52 feet long, and 20 feet high. The materials were quarried from the surface of the river Neva; and the whole stood glittering against the sun with a brilliancy almost equal to his own. Six cannons of ice, two bombs and mortars, all of the same materials, were planted before this extraordinary edifice. The cannon were three pounders; they were charged with gun-powder, and fired off. The ball of one of them pierced an oak plank two inches thick, at 60 paces distance, and the piece did not burst with the explosion.</p>	<p>In melting of ice, if it be laid upon some substances it melts faster than upon others. It melts sooner in a silver plate than on the palm of the hand, and sooner upon copper than any other metal whatever. It melts sooner in water than in air of an equal temperature; sooner in water a little warm, than in air near the fire where it is hotter. It is sooner dissolved in vacuo than in the atmosphere. If it takes 20 minutes to dissolve in the open air, only four will be requisite to melt it in vacuo.</p>	<p>9 Melts more easily on some substances than others.</p>
	<p>Where the summer heats are great, ice becomes an article of luxury; and is indeed exceedingly salutary by preventing, in some measure, the bad effects of these heats on the human body. A ready way of making ice where none is naturally formed, or of preserving it in summer where it is formed in small quantity in the winter time, is, in some countries, eagerly sought after. The snowflakes with which ice melts furnishes an easy method of preserving it. Water, congealed in six minutes, will not resume its fluidity in some hours: (See FLUIDITY.) Nothing more then is requisite to preserve ice, than to bury it to a small depth in the ground, and cover it with a sufficient quantity of thatch to keep out the external heat. Though water placed in such a situation would always retain its fluidity, yet the great quantity of heat absorbed by ice in thawing prevents the dissolution of any considerable quantity of it, where large masses are put together.</p>	<p>If snow or pounded ice (but snow is preferable) be mixed with any salt, such as copperas, alum, salt-petre, or common salt, in the proportion of four pounds of snow to one of salt, the mixture will soon melt; but at the same time grow so much colder, that if a small basin of water is set into it, it will soon be frozen. In this case the congelation begins from the bottom upwards, which is contrary to what happens when water is frozen in the open air. Of all the different kinds of salts, sal-ammoniac is found to be most efficacious in producing ice; but it is said that water may be frozen without any salt whatever. For this purpose</p>	<p>10 Is easily preserved.</p>
	<p>Freezing is much more expeditiously carried on where the liquor is little disturbed, than if it is greatly so; though an absolute tranquillity, as we have already seen, is prejudicial to this operation. In such a case, if the water is disturbed, though by a warm air, it will be congealed in an instant.</p>		<p>11 Artificial freezing mixtures.</p>

Congela-
tion.

pose we need only to fill a small deep pewter-dish with water; and upon that place a common pewter-plate filled, but not heaped, with snow, so that the bottom of the pewter-plate may be in contact with the water. Bring this small apparatus near the fire, and as the snow melts on being stirred, the water will be frozen on the back of the plate. This experiment deserves well to be considered, as it would strongly indicate an actual expulsion of cold as a substance from snow, upon its melting by the heat of the fire. It is similar to one of Geoffroy's, which shews that cold is produced by throwing burning coals into water. See COLD, n° 5.

Though any kind of salt produces a great degree of cold on being mixed with snow, yet the pure acids of nitre and sea-salt have been found more efficacious in this respect than any known substances. Of these, spirit of nitre produces the most violent degree of cold, and spirit of sea-salt the most lasting.

But by methods of this kind ice can only be made from being in possession of some quantity of it, or of snow, already. In those countries, therefore, where no ice is ever formed naturally, it could never be procured, and in those it is most desirable. Boerhaave gives a method of making ice without either ice or snow. He directs, at whatever season of the year this is attempted, to procure the coldest water that can be got. This is to be mixed with salt in the proportion of three ounces to a quart. Of all saline substances, sal-ammoniac is found to answer best. Another quart of water is to be prepared in the same manner. The solution of the salt will make the water in each much colder than before. They are then to be mixed together. Other two quarts of water prepared and mixed in the same manner are to be added to these. The whole of this operation is to be carried on in a cold cellar; and a glass of common water is then to be placed in the vessel of liquor thus artificially cooled, which will be turned into ice in the space of 12 hours.

A process for making ice in the East Indies, without the assistance of snow or salt of any kind, has been communicated to the Royal Society by Sir Robert Barker, F. R. S. The places where this method is followed lie between 25° and 23° degrees of north latitude, where natural ice is seldom or never seen. The following method is used in freezing the water. On a large open plain three or four excavations are made, each about 30 feet square and two feet deep. The bottoms are strewn about eight inches or a foot deep with sugar-cane, or the stems of the large Indian corn dried. Upon this bed are placed in rows, near to each other, a number of small shallow earthen pans, for containing the water to be frozen. These are unglazed; scarce a quarter of an inch thick; and so porous, that the water visibly penetrates them. Towards the dusk of the evening they are filled with soft water which has been boiled, and then left in the aforesaid situation. The ice-makers usually attend the pits before the sun is above the horizon. They collect in buckets what is frozen by pouring the whole contents of the pans into them, and thereby retaining the ice, which is daily conveyed to the grand receptacle or place of preservation. This is generally prepared on some high dry situation, by sinking a pit of 14 or 15 feet deep, lined first with straw, and then

with a coarse kind of blanketing, where it is best down with rammers, till at length its own accumulated cold again freezes and forms it into one solid mass. The mouth of the pit is well secured with straw and blankets from the external air, and a thatched roof is thrown over the whole.

The quantity of ice depends materially on the weather; and consequently it sometimes happens that no congelation takes place; at other times perhaps half the quantity will be frozen, and often the whole contents will be formed into a solid cake. The more clear and serene the weather, and the lighter the atmosphere, the more favourable it is for congelation. A frequent change of winds and clouds are certain preventatives; so that in a very sharp cold night, scarce any ice will often be formed, while the whole contents will be frozen through when the night has been sensibly warmer.

The author of this account is of opinion, that water by being placed in such a situation, free from receiving any heat from other bodies, may be made to freeze in a pretty warm air, by having large surfaces exposed to it. The reason of this seems to be, that some part of its sensible heat is perpetually flying off by its insensible evaporation. The spongy substances on which the pans are set are but ill adapted to furnish it with a new supply; for, of all others, either heat or cold is most difficultly transmitted through bodies of this kind. The evaporation of the liquid which transudes through the pores of the earthen vessels, undoubtedly serves also to increase the cold; and thus the more, on account of the extreme thinness with which it is spread over them.

That ice is capable of multiplying itself, seems very probable from an observation of Sir Robert Barker's; namely, that when it is collected by the East Indians, in the manner above described, it becomes capable, by being mixed with salt, of freezing more water, or other kinds of fluids, and that during the severe heats of the summer season. The sherbets, creams, or whatever other fluids are intended to be frozen in this manner, are inclosed in silver cups containing about a pint; having their covers well luted on with paste, and placed in a large vessel filled with ice, salt-petre, and common salt; of the two last an equal quantity, and a little water is added to dissolve the whole. By this composition the contents of the cups are immediately frozen to the consistence of the ice creams in Europe; but plain water will become so hard as to require a mallet and knife to break it. Upon applying a thermometer to one of these lumps of ice, it has been known to sink two or three degrees below the freezing point; which shews, that even in the warmest climates a very great degree of cold may be produced: for the hardness of ice is always in proportion to the degree of cold to which it is exposed; and if it is internally cooled to 2 or 3 degrees below the freezing point, we are sure that a violent degree of cold has been exerted upon it externally; for the usual temperature of ice when first frozen, is 32 degrees.

Congius of humours, crowded together and hardened in any part of the body, and there forming a preternatural tumor.

Congestion is effected by little and little ; in which it differs from *defluxion*, which is more sudden.

CONGIUS, a liquid measure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the urna, or fix sextarii. The congius in English measure contains 2,070,676 solid inches ; that is, seven pints, 4,942 solid inches.

CONGLOBATE GLAND. See ANATOMY, n^o 391.

CONGLOMERATE GLAND. *Ibid.*

CONGLOMERATE *Flowers*, are those growing on a branching foot-stalk, to which they are irregularly but closely connected. This mode of inflorescence, as Linnæus terms it, is opposed to that in which the flowers are irregularly and loosely supported on their foot-stalks, hence termed a *diffuse panicle* *. The term is exemplified in several of the grasses, particularly in some species of the *poa*, fescue grass, and agrostis.

CONGLUTINATION, the gluing or fastening any two bodies together by the intromission of a third, whose parts are visciduous and tenacious, in the nature of glue. See GLUE.

CONGO, a kingdom of Africa, bounded on the north by the river Zair, or Zarah, which divides it from Loanga ; on the south by the river Danda, which separates it from Angola ; on the east by the kingdoms of Fungono and Metamba, and the burnt mountains of the sun, those of crystal or salt-petre and silver, or (according to Anthony Cavazzi, a late traveller into those parts) by the mountains of Coanza Ber-bela, and the great mountain of Chilandia or Aquilonda ; and on the west by that part of the Atlantic ocean called the Ethiopic sea, or the sea of Congo. According to these limits, Congo Proper extends about three degrees from north to south ; lying between 6° and 9° S. Lat. ; but widens in its breadth inland, by the course of the river Zair, which runs winding above two degrees more to the north. Its length from east to west is very uncertain, as no observations have been taken of the exact situation of those mountains which bound it.

The history of this kingdom affords but few interesting particulars. Before its discovery by the Portuguese, the history is altogether uncertain and fabulous, as the inhabitants were totally unacquainted with letters and learning. So little were they acquainted with chronology, that it is said they did not even distinguish between day and night ; much less could they compute their time by moons or years ; and therefore could remember past transactions only by saying they happened in such a king's reign.

The country was discovered by the Portuguese in 1484. The discoverer was named Diego Cam, an expert and bold sailor. He was very well received by the natives, and sent some of his men with presents to the king ; but they being detained by unexpected accidents beyond the promised time of their return, Com was obliged to sail away without them, and took with him four young Congoeze, as hostages for the safety of his countrymen. These he taught the Portuguese language, in which they made

such progress that king John was highly pleased, and sent them back next year to Congo with rich presents ; charging them to exhort their monarch, in his name, to become a convert to the Christian religion, and to permit it to be propagated through his dominions. A firm alliance was concluded between the two monarchs, which continues to this day, though not without some interruptions, to which the Portuguese themselves have given occasion more than the natives.

Any particular account we have of this kingdom, rests almost entirely on the credit of Anthony Cavazzi, the traveller above-mentioned. He was a capuchin-friar, a native of the duchy of Modena, and was sent missionary into those parts *de propaganda fide*, in the year 1654, and arrived at Congo the same year. During his stay there, his zeal to make converts made him travel through all these different kingdoms ; and the credit he gained, as well as the great employments he was intrusted with, gave him an opportunity of informing himself of every thing relating to them with great exactness. The extent and situation, however, he could not possibly ascertain, for want of instruments ; nor hath this defect been since supplied. According to him, the dominions of Congo extended a great deal further eastward and southward before the introduction of Christianity than afterwards ; a great number of the states that were under the Congoeze monarchs, either as subjects, or tributary, having withdrawn their allegiance out of dislike to them on that account. Not content with opposing the officers and troops that came annually to raise the tribute imposed by the king, they made such frequent and powerful incursions into his dominions, that they obliged him to draw his forces nearer the centre of Congo to prevent an invasion ; by which means, the kingdom, from an extent of 600 leagues, was reduced to less than one half.

Congo Proper being situated within the torrid zone, is liable to excessive heats ; as it lies on the southern side of the equinoctial, the seasons are of course opposite to ours. They reckon only two principal seasons, the summer and winter ; the former begins in October, and continues till February or March ; during which time the sun's rays dart with such force, that the atmosphere appears to an European to be in a flame. The excessive heat, however, is mitigated by the equal length of the days and nights, as well as by the winds, breezes, rains and dews. The winter takes up the other part of the year ; and is said by the natives to be proportionally cold, though to an European it would appear hot. These two seasons they divide into six lesser ones, *viz.* Massanza, Neasû, Ecuudi, Quitombo, Quibiso, and Quibangela.

Massanza begins with the month of October, which is the beginning of their spring. The rains begin to fall at that time, and continue during the next two, and sometimes three, months. When they do so, the low lands are commonly overflowed by the extraordinary floods, and all their corn carried off. A disaster of this kind is commonly followed by a famine ; for the lazy inhabitants take no care to lay up any provisions, although such misfortunes happen very frequently. This first season they reckon commences at the time the plants begin to spring.

Account of
the climate
and seasons.

The second season, *Neafu*, begins about the end of January, when the produce of their lands has arrived at its full height, and wants but a few days of being ripened for harvest. This first crop is no sooner gathered in, than they sow their fields afresh, their land commonly yielding them two harvests.

The third and fourth seasons, called *Ecundi* and *Quitambo*, are frequently blended together towards the middle of March, when the more gentle rains begin to fall, and continue to do so till the month of May. These two seasons are distinguished by the greater or lesser quantity of rain that falls during that interval. During the rest of the time, the air is either very clear, hot, and dry; or the clouds being overcharged with electric matter, burst out into the most terrible thunders and lightnings, without yielding the least drop of rain, though they seem loaded with it.

The two last, *viz.* the *Quibio* and *Quibangala*, make up their short winter, which consists not in frost or snow, but in dry, blasting winds, which strip the earth of all its verdure, till the next *Maffanza* begins to restore them to their former bloom.

They now divide their year into twelve lunar months, and begin it in September. They have also weeks consisting of four days only, the last of which is their sabbath; and on it they religiously abstain from every kind of work. This practice, the compilers of the Universal History conjecture to have arisen from the extreme laziness for which this people, and indeed all the African nations, are so remarkable. To this shameful indolence also is to be ascribed the little produce they reap from their lands, while the Portuguese settled among them, who are at more pains in the cultivation of theirs, enjoy all manner of plenty. The natives, however, had rather run the risk of the most terrible famines, than be at the tenth part of the labour they see the Portuguese take. They seem to think it below them to use any other exercises than those of dancing, leaping, hunting, shooting, &c.; the rest of their time they spend in smoking, and downright idleness, committing the laborious part of their household affairs to their slaves, or, in want of them, to their wives. Nothing is more common than to see these poor creatures toiling in the fields and woods with a child tied to their backs, and fainting under their excessive labour and heavy burdens, or (which is still worse) lunker and thirst. What is yet more surprisingly shameful is, that though they have plenty of domestic animals which they might easily make use of for cultivating their grounds, and for other laborious services, and though they see the Portuguese do it every day to great advantage; yet they will rather see their tender females sink under their toil and labour, than be at the trouble of breeding up any of these useful creatures to their assistance.

The ground produces variety of grain, but no corn or rice except what is cultivated by the Portuguese. Their maize, or Indian wheat, grows very strong, and is well laden. This, being well ground, they make into bread, or boil with water into a kind of pap. Of this they have four kinds; one of which resembling what we call French wheat, is produced in plenty, and makes some amends for the want of industry in the people. They cultivate also a variety of the pease

and bean kind: but what they chiefly live upon, as most suitable to their lazy disposition, is a kind of nut, like our filberds, which fall to the ground of themselves, and are to be found every where; every nut that falls to the ground, producing a new shrub next year. They have scarcely any fruit-trees, but what have been brought thither by the Portuguese. They have various sorts of palm-trees, useful both by their fruit, leaves, and their juice, which is easily converted into wine; also by affording a kind of oil with which they dress their victuals, though the Europeans use it only to burn in their lamps. They have also a vast number of plants and shrubs, which it would be impossible to describe or enumerate. What is the only thing that the ground will not produce. It passes forth, indeed, the straw and the ear; the former of which grows high enough, we are told, to hide a man on horseback, but the latter is empty, without one grain fit for use. Father Labat, however, who had lived a considerable time in some of the American islands, where he had observed the same thing, tells us, that he had the curiosity to examine those ears more carefully, and had found some few grains; and that, having sowed them afresh, they produced very long ears, full of large heavy grain. Whence he conjectures, that if the Portuguese had tried the same experiment in their African settlements, it might perhaps have been attended with the same success.

In the low lands the grass grows so high, rank, and thick, that it becomes one of the most dangerous receptacles for wild beasts, serpents, and other venomous insects: on this account travelling is exceedingly hazardous, as they have few beaten roads in the whole country, and travellers are obliged to march over it through vast plains, in continual danger of being devoured or stung to death; to say nothing of the manifold diseases produced by the unwholesome dews with which the grass is covered during some part of the day. The only method of guarding against all these evils effectually, is by setting fire to the grass in the hot weather, when it is quite parched by the heat of the sun: but even this cannot be done without the greatest danger; because both the wild beasts and venomous reptiles, being roused out of their places of retirement, will fly furiously at those who happen to be in the way. In this case there is no possibility of escaping, but by climbing up the highest trees, or defending one's self by fire-arms or other weapons. In such emergencies, the natives have a much better chance than the Europeans; the former being able to climb trees with surprising swiftness; while the latter must be assisted with rope-ladders, which they commonly cause their blacks to carry about with them, and to go up and fasten to one of the branches.

The flowers are here exceedingly beautiful and numerous. Almost every field and grove yields a much nobler prospect than the European gardens can boast of, notwithstanding the pains bestowed on their cultivation. The flowers are remarkable, not only for the prodigious variety of their colours, but the vast quantity of heads which grow upon one stalk. In the day-time, indeed, they seem to have lost their natural fragrantcy; that being in some measure exhaled

Congo.

by the heat of the sun : but this is amply compensated after its setting, and more especially a little before its rising, when their sweetness is again condensed, and revived by the coldness and dews of the night, after which they exhale their various refreshing scents in a much higher degree than ours. The lilies, which there grow naturally in the fields, valleys, and woods, excel those of our gardens, not only in their extreme whiteness, but much more in a delightful fragrant, without offending the head, as the European lilies do by their faintish sweetness. The tulips which there grow wild, though generally called *Perlie*, have something so surprisingly charming in the variety and combination of their colours, that they dazzle the eyes of an intense beholder : neither do their flowers grow singly as with us, but ten or twelve upon one stalk ; and with this double advantage, that they diffuse a very reviving and agreeable sweetness, and continue much longer in their full bloom. Of the same nature are their tuberose, hyacinths, and other native flowers ; which spring up in vast groups of 100 and 200 from one root, though somewhat smaller than ours ; some of them finely variegated, and all of them yielding an agreeable smell. The roses, jessamines, and other exotics brought thither from Europe or America, come up likewise in great perfection ; but require a constant supply of water, and diligent attendance to prevent them from degenerating. The American jessamine, in particular, instead of single flowers, will grow up by dozens in a bunch ; some of them of an exquisite white, and others of the colour of the most vivid fire.

11
Animals of
different
kinds.

A vast variety of animals of different kinds are found in the kingdom of Congo ; the chief of which are the elephant. This creature is mostly found in the province of Bamba, which abounds with woods, pasture, and plenty of water ; the elephants delighting much to bathe themselves during the heat of the day. They commonly go in troops of an hundred or more ; and some of them are of such a monstrous size, that we are told the print of their hoof hath measured four, nay seven, spans in diameter. From the hair of their tails, and that of some other animals, the natives, especially the women, weave themselves collars, bracelets, girdles, &c. with variety of devices and figures, which denote their quality ; and are in such esteem, that the hair of two elephants tails is sufficient to buy a slave. The reason of this is, that the natives have not the art of taming them, but are obliged to send some of their bravest and stoutest men to hunt them in the woods ; which is not done without great labour and danger, they being here exceedingly fierce. The most common way of hunting them is by digging deep holes in the ground, the top of which they cover with branches and leaves, as is practised in most parts of Asia.

Lions, leopards, tigers, wolves, and other beasts of prey, abound here in great plenty, and do much damage. Here are also a vast variety of monkeys of all sizes and shapes. The zebra, well known for its extreme beauty and swiftness, is also met with in this country. They have also a variety of buffaloes and wild asses ; but the *dante* seems to be an animal peculiar to this kingdom. It is shaped and coloured much like an

Congo.

ox, though not so large. Its skin is commonly bought by the Portuguese, and sent into Germany to be tanned and made into targets, which are then called *dantes*. The natives make use of their raw hide dried, to make their shields ; which are so tough that no arrow or dart can pierce them ; and they are also large enough to cover the whole body. The creature is vastly swift ; and when wounded, will follow the scent or smoke of the gunpowder with such fury, that the hunter is obliged to climb up a tree with all possible speed ; and this retreat he always takes care to secure before he ventures to fire. The wounded beast finding its enemy out of its reach, stays for him at the foot of the tree, and will not stir from it ; of which the hunter taking the advantage, dispatches it with repeated shots. The forests of Congo also swarm with wild dogs, who, like the wolves, prey upon the tame cattle, and are so fierce that they will attack armed men. Their teeth are exceeding keen and sharp ; they never bark, but make a dreadful howling when famished or in pursuit of their prey.

12
Birds.

This country also abounds with all the different kinds of birds that are to be found in other warm climates. One sort, which they call *birds of music*, is greatly esteemed, inasmuch that persons of the highest rank have from time immemorial taken the greatest delight in keeping them in cages and aviaries for the sake of their surprising melody. On the other hand, as the Congoese are superstitious to the last degree, there are several kinds of birds which they look upon as ominous, and are so terrified at the sight or hearing of them, that if they were going to enter upon ever so momentous an expedition, if they were met in council, or going to engage an enemy with ever so great an advantage, the flight or cry of such birds would throw them into a general panic, and disperse them in the utmost haste and confusion. The most dreadful of the ominous kind are the crows, ravens, bats, and owls. The great owl is the most terrible of all, and to him they give the name of *kariam pemba*, by which words they likewise denote the devil.

Fish of different kinds abound on the coasts of Congo in great numbers. But the inland parts are infested with such numbers of serpents, scorpions, and other venomous insects, as are perhaps sufficient to overbalance every natural advantage we have yet mentioned. The most pernicious and dangerous kind are the ants ; of which they reckon no less than six several species of different colours and sizes ; all of them formidable, on account of their prodigious numbers, and the mischief they do not only to the fruits of the earth, but to men and beasts ; whom they will surround in the night time, and devour even to the very bone. It is a common practice, we are told, to condemn persons guilty of some atrocious crimes, to be stripped naked, tied hand and foot, and thrown into a hole where these insects swarm ; where they are sure to be devoured by them in less than 24 hours to the very bones. But criminals are not the only persons who are in danger from the jaws of these little devouring insects. People may be attacked by them, as we have already hinted, in the night time, and while they are sleeping in their beds. This obliges the natives to be careful where they lie down, and to

13
Ants very
dangerous.

kindle

Congo.

kindle a small fire, or at least to have a circle of burning hot embers round their beds. This caution is still more necessary in the country villages and hamlets, where persons are otherwise in danger of being attacked by millions of them in the dead of the night. In such a case the only expedient to save one's self is to jump up as soon as one feels the bite, to brush them off with all possible speed, and then at once to set the house on fire. The danger is still greater in travelling through the country, where a person is often obliged to take up his lodging on the bare ground; and may be overtaken during the heat of the day with such profound sleep, as not to be awaked by these diminutive animals till they have made their way through the skin; and in such a case nothing will prevent their devouring a man alive, though there were ever so many hands to assist him: in such incredible quantities do these creatures abound, notwithstanding the great numbers of monkeys who are continually ferreting the ants out of their retreats, and feed upon them with the utmost avidity. This can only be ascribed to the natural laziness and indolence of the inhabitants; which is such, that they not only neglect to rid their lands of them by proper cultivation, but will suffer their houses, nay even their very churches, to be undermined by them. Another kind of these destructive vermin lie so thick upon the paths and highways, that a person cannot walk without treading upon, and having his legs and thighs almost devoured by them. A third sort of a white and red colour, but very small, will gnaw their way through the hardest wood, penetrate into a strong chest, and in a little while devour all the clothes, linen, and every thing that is in it. A fourth sort, small and black, leave a most intolerable stench upon every thing they touch or crawl over, whether clothes or household-stuff; which are not easily sweetened again: or if they pass over victuals, they are entirely spoiled. A fifth sort harbour chiefly on the leaves and branches of trees; and if a man chance to climb up thither to save himself from a wild beast, he is so tormented by them, that nothing but the fear of the jaws of the one could make him endure the stings of the other. A sixth sort is of the flying kind, and is probably one of the former kinds, that live wholly under ground, till nature furnishes them with wings. After this, they rise in such swarms as darken the air, and would make terrible havoc among all kinds of vegetables, did not the natives come out against them in whole companies, and by dint of flaps, and other flat weapons, knock them down by myriads, and then laying them in heaps, set fire to their wings, which half broils them for food. Amidst all this variety of pernicious insects, however, they have one species of a more friendly and profitable kind, viz. the industrious bee, which furnishes the inhabitants with honey and wax in such plenty, that there is scarce a hollow tree, cleft of a rock, or chop of the earth, in which their combs are not found in great quantities.

¹⁴ Congo with respect to the populousness of the kingdom of Congo, some authors writing either from mere conjecture, or at best precarious inferences, have represented it as thinly peopled. The accounts of the missionaries and Portuguese, however, are directly op-

posite to these. They found the country for the most part covered with towns and villages, and these swarming with inhabitants; the cities well filled with people, particularly the metropolis, which is said to contain above 50,000 souls. The provinces, though not equally populous, yet in the whole, make up such an amount, as plainly proves, that what is wanting in the one is amply made up by another. We are told that the duchy of Bamba is still able to raise 200,000 fighting men, and was formerly in a condition to raise double that number; and that the army of the king of Congo, in the year 1665, consisted of 900,000 fighting men, who were attended by an infinite number of women, children, and slaves. The numbers of the Congoese will appear the more credible, when we consider the extreme fecundity of their women, the hardiness with which they bring up their children, and the stoutness and healthiness of their men. In some villages, if the missionaries are to be credited, the number of children is so great, that a father will part with one or two, for any commodity he wants, or even for some trifling bawble he fancies; so that the number of slaves they sell abroad, seldom amounts, *communibus annis*, to less than 15 or 16,000.

There is scarce a nation on earth that have a higher opinion of themselves or their country, than the Congoese, or that is more hardened against all conviction to the contrary, from reason, experience, or the most impartial comparison with other countries in Europe or Asia. Indeed, it is impossible they should think otherwise, when it is one of the fundamentals of their belief, that the rest of the world was the work of angels, but that the kingdom of Congo, in its full and ancient extent, was the handy-work of the supreme Architect; and must of course have vast prerogatives and advantages over all others. When told of the magnificence of the European and Asiatic courts, their immense revenues, the grandeur of their palaces and edifices, the riches and happiness of their subjects, the great progress they have made in the arts and sciences to which their country is wholly a stranger, they coolly answer, that all this comes vastly short of the dignity and splendor of the kings and kingdom of Congo; and that there can be but one Congo in the world, to the happiness of whose monarch and people all the rest were created to contribute, and to whose treasury the sea and rivers pay their constant tribute of 'zim-bis, (or shells, which are their current coin); whilst other princes must condescend to enrich themselves by digging through rocks and mountains, to come at the excrements of the earth, for so they style gold and silver which are in such request among other nations. Accordingly, they imagine, that the nations which come to traffic with them, are forced to that servile employment by their poverty and the badness of their country, rather than induced to it by luxury or avarice; whilst they themselves can indulge their natural indolence or sloth, though attended with the most pinching poverty, rather than disgrace the dignity of their blood by the least effort of industry, which, how laudable and beneficial soever, is looked upon by them as only a lesser degree of slavery. But though they generally esteem it so much below their dignity to apply to any useful work, they think it no disgrace to beg or

Congo.

¹⁵ Congoese have a high opinion of themselves.

¹⁶ Their intolerable sloth, pride, &c.

Congo

1
Congregation.

steal. With respect to the first, they are said to be the most shameless and importunate beggars in the world. They will take no denial, spare no crouching, lying, prayers, to obtain what they want, nor curses and ill language when sent away without it. With regard to the last, they deem no theft unlawful or scandalous, except it be committed in a private manner, without the knowledge of the person wronged. It is esteemed a piece of bravery and gallantry to wrench any thing from another by violence; and this kind of theft is so common, not only among the vulgar, but also among the great ones, that they make no scruple, in their travels from place to place, to seize not only upon all the provisions they meet with in towns and villages, but upon every thing else that falls in their way. These violences oblige the poor people to conceal the few valuables they have, in some secret place out of the knowledge and reach of those harpies; and they think themselves well off, if they can escape a severe bastonading, or other cruel usage frequently inflicted upon them in order to make them discover the place of their concealment.

27
Complexion, character, customs, &c.

The complexion of the natives, both men and women, is black, though not in the same degree; some being of a much deeper black than others. Their hair is black and finely curled; some have it also of a dark sandy colour: their eyes are mostly of a fine lively black; but some are of a dark sea-colour. They have neither flat noses nor thick lips like the Nubians and other negroes. Their stature is mostly of the middle size; and, excepting their black complexion, they much resemble the Portuguese. In their temper they are mistrustful, envious, jealous, and treacherous; and where they once take a distaste or affront, will spare no pains, nor stick at any means however base, to be avenged of, and crush their enemy under their feet. There is no such thing among them as natural affection. A husband, if an heathen, may take as many wives as he pleases; and if a Christian, may have any number of concubines, whom he may divorce at pleasure, or even sell them though with child. So little regard have they for their children, that there is scarce one among them who will not sell a son or a daughter, or perhaps both, for a piece of cloth, a collar or girdle of coral or beads, and often for a bottle of wine or brandy.

18
Religion.

The religion of the Congoes in many parts is downright idolatry, accompanied with the most ridiculous superstitions, and the most absurd and detestable rites invented by their gangas or priests; and even in those parts where Christianity is professed, it is so darkened by superstitions of one kind or other, that we may justly question whether the people are any gainers by the exchange.

19
Government.

The government of this kingdom is monarchical, and as despotic as any in Asia or Africa. The kings are the sole proprietors of all the lands within their dominions; and these they can dispose of to whom they please, upon condition they pay a certain tribute out of them; upon failure of the payment of which, or any other neglect, they turn them out. Even the princes of the blood are subjected to the same law; so that there is no person of any rank or quality whatever, that can bequeath a foot of land to his heirs or

successors; and when these owners under the crown die, the lands immediately return to it again, whether they were in their possession, or had been let to ever so many tenants under them; so that it entirely depends on the prince whether these lands shall be continued in the same, or be disposed into other hands. The Portuguese, however, since their settling in these parts, have prevailed upon the monarchs to permit the heirs and successors to continue in the quiet possession of such lands, in order to avoid the confusions, or even rebellions, which the alienation and deprival of them frequently occasioned, and to oblige the tenants of them to pay their tribute more exactly and readily than they did before.

In Congo there are only three offences deemed capital, viz. treason, murder, and sorcery. In the former the offender's punishment chiefly depends on the prince's will, who commonly condemns him to the loss of his head and estate, the latter being confiscated for the king's use. A murderer is immediately beheaded, unless some atrocious circumstances seem to require, or the relations of the deceased petition for, a more severe death; in which last case, he is usually delivered up to them, to suffer such punishment as they think proper to inflict on him, and which is generally put in execution immediately after sentence is pronounced. Magic or sorcery, a crime very common in the unconverted provinces, is, on that account, more severely punished by the Christians; and the person convicted of it is immediately burned alive; which punishment seems to have been introduced by the Portuguese. Other punishments for lesser crimes are the bastinado, whipping, fines, and imprisonment. The Portuguese are allowed a judge of their own nation, not only for their law-suits among themselves, but between them and the natives, who decides all controversies according to the laws of Portugal; a privilege granted to no other Europeans.

20
Commerce.

St Salvador is the chief place of traffic the Portuguese and other Europeans have in this country. There are thought to be about 4000 of them settled here, who trade with most parts of the kingdom. The chief commodities they bring thither are either the product of Brazil, or European manufactures. The former consist chiefly of grains, fruits, plants, &c.; the latter of Turkey carpets, English cloth, and other stuffs; copper, brass vessels, some kinds of blue earthen ware, rings, and ornaments of gold, silver, and other base metals; coral, glass-beads, bugles, and other trinkets; light stuffs made of cotton, woolen, and linen, for cloathing; and a great variety of tools and other utensils. In return for these, they carry off a great number of slaves, amounting to 15 or 16,000 annually, as we have already observed. Formerly they used also to carry away elephants teeth, furs, and other commodities of the country; but these branches of commerce are now greatly decayed; and the slave-trade is what the Portuguese merchants principally depend on.

CONGREGATION, an assembly of several ecclesiastics united, so as to constitute one body; as an assembly of cardinals, in the constitution of the pope's court, met for the dispatch of some particular business.

These

congrega-
tionalists
Congreve.

These assemblies, being 16 in number, are distributed into several chambers, after the manner of our offices and courts: the first whereof is the pope's congregation, whose business it is to prepare the most difficult beneficiary matters to be afterward debated in the consistory: the second is the congregation of the holy office, or the inquisition: the third is the congregation *de propaganda fide*: the fourth is the congregation for explaining the council of Trent: the fifth is the congregation of the index, deputed to examine into pernicious and heretical books: the sixth is the congregation of immunities, established to obviate the difficulties that arise in the judgments of such suits as are carried on against churchmen: the seventh is the congregation of bishops and regulars: the eighth is the congregation for the examination of bishops, &c. It is also used for a company or society of religious, cantoned out of any order, so as to make a subdivision of the order itself: as the congregation of Cluny, &c. among the Benedictines. It is likewise used for assemblies of pious persons, in manner of fraternities.

CONGREGATIONALISTS, in church-history, a sect of Protestants who reject all church-government, except that of a single congregation under the direction of one pastor.

CONGRESS, in political affairs, an assembly of commissioners, envoys, deputies, &c. from several courts meeting to concert matters for their common good.

CONGRESS, in a judicial sense, the trial made by appointment of a judge, before sergeants and matrons, in order to prove whether or no a man be impotent, before sentence is passed for the dissolution of a marriage solicited upon such a complaint.

Neither the civil nor canon law makes any mention of the trial of virility by congress: it had its origin in France, from the boldness of a young fellow, who, in open court, having been hard pressed by his wife, demanded the *congruiss*. The judge, surprised with the novelty of the demand, found it could not be denied, as being the surest evidence that case could admit of. In time it became a branch in the French jurisprudence, and was authorized by decreets and arrests. It obtained for about 120 years; and was annulled by an arrest of parliament in 1677, as being found precarious; some having failed under the experiment out of mere modesty and shame, which is found to have the same effect with actual impotency.

CONGREVE (William), a younger brother of an ancient family in Staffordshire. His father was employed in the stewardship of the great estate of the earl of Burlington in Ireland, where he resided many years; and our author was born there in 1672. Mr Congreve entered into the Middle-Temple when he came to England, and began to study the law; but his bias was toward polite literature and poetry. His first performance was a novel, intitled, *Incognita*, or, *Love and Duty reconcil'd*. He soon after began his comedy of the *Old Bachelor*; which was the amusement of some leisure hours during a slow recovery from a fit of illness soon after his return to England; and was in itself so perfect, that Mr Dryden, on its being shewn to him, declared he had never in his life seen such a first play. When brought on the stage in 1693, it met with such universal approbation, that Mr

Congreve, though he was but 19 years old at the time of his writing it, became now considered as a prop to the declining stage, and a rising genius in dramatic poetry. The next year he produced the *Double Dealer*; which, for what reason is not obvious, did not meet with so much success as the former. The merit of his first play, however, had obtained him the favour and patronage of lord Halifax, and some peculiar marks of distinction from queen Mary; on whose death, which happened in the close of this year, he wrote a very elegant elegiac pastoral. In 1695, when Betterton opened the new house in Lincoln's-inn Fields, Mr Congreve joining with him, gave him his comedy of *Love for Love*, with which the company opened their campaign; and which met with such success, that they immediately offered the author a share in the management of the house, on condition of his furnishing them with one play yearly. This offer he accepted; but whether through indolence, or that correctness which he looked upon as necessary to his works, his *Mourning Bride* did not come out till 1697, nor his *Way of the World* till two years after that. The indifferent success this last mentioned play, though an exceeding good one, met with from the public, completed that disgust to the theatre, which a long contest with Jeremy Collier, who had attacked the immoralities of the English stage, and more especially some of his pieces, had begun, and he determined never more to write for the stage. However, though he quitted dramatic writing, he did not lay down the pen entirely; but occasionally wrote many little pieces both in prose and verse, all of which stand on the records of literary fame. It is very possible, however, that he might not so soon have given way to this disgust, had not the easiness of his circumstances rendered any subservience to the opinions and caprice of the town absolutely unnecessary to him. For his abilities having very early in life raised him to the acquaintance of the earl of Halifax, who was then the Mæcenas of the age, that nobleman, desirous of raising so promising a genius above the necessity of too hasty productions, made him one of the commissioners for licensing hackney-coaches, or, according to Coxeter, a commission of the wine-licence. He soon after bestowed on him a place in the pipe-office; and not long after gave him a post in the customs worth 600 l. *per annum*. In the year 1718, he was appointed secretary of Jamaica; so that, with all together, his income towards the latter part of his life was upwards of 1200 l. a-year.

The greatest part of the last 20 years of his life was spent in ease and retirement; and he either did not, or affected not to give himself any trouble about reputation. Yet some part of that conduct might proceed from a degree of pride; to which purpose, T. Cibber, in his lives of the poets, vol. IV. p. 93, relates the following anecdote of him: "When the celebrated Voltaire was in England, he waited upon Mr Congreve, and passed some compliments upon the merit and reputation of his works. Congreve thanked him; but at the same time told that ingenious foreigner, that he did not chuse to be considered as an author, but only as a private gentleman, and in that light expected to be visited. Voltaire answered, that

Congreve.

Congruity. if he had never been any thing but a private gentleman, in all probability he had never been troubled with that visit. He observes, in his own account of the transaction, that he was not a little disgusted with so unseemable a piece of vanity."

Towards the close of his life he was much afflicted with the gout; and making a tour to Bath for the benefit of the waters, was unfortunately overturned in his chariot; by which, it is supposed, he got some inward bruise, as he ever after complained of a pain in his side; and, on his return to London, continued gradually declining in his health, till the 19th of January 1729, when he died, aged 57; and, on the 26th following, was buried in Westminster Abbey, the pall being supported by persons of the first distinction.

CONGRUITY, a suitableness or relation of agreement between things.

The terms *congruity* and *propriety* are not applicable to any single object: they imply a plurality, and obviously signify a particular relation between different objects. Thus we currently say, that a decent garb is suitable or proper for a judge; modest behaviour for a young woman; and a lofty style for an epic poem: and, on the other hand, that it is unsuitable or incongruous to see a little woman sunk in an overgrown farthingale, a coat richly embroidered covering coarse and dirty linen, a mean subject in an elevated style, an elevated subject in a mean style, a first minister darning his wife's stocking, or a reverend prelate in lawn sleeves dancing a hornpipe.

The perception we have of this relation, which seems peculiar to man, cannot proceed from any other cause, but from a *sense* of congruity or propriety: for, supposing us destitute of that sense, the terms would be to us unintelligible.

It is a matter of experience, that congruity or propriety, where-ever perceived, is agreeable; and that incongruity or impropriety, where-ever perceived, is disagreeable. The only difficulty is, to ascertain what are the particular objects that in conjunction suggest these relations; for there are many objects that do not: the sea, for example, viewed in conjunction with a picture, or a man viewed in conjunction with a mountain, suggest not either congruity or incongruity. It seems natural to infer, what will be found true by induction, that we never perceive congruity nor incongruity but among things that are connected together by some relation; such as a man and his actions, a principal and its accessories, a subject and its ornaments. We are indeed so framed by nature, as, among things so connected, to require a certain suitableness or correspondence, termed *congruity* or *propriety*; and to be displeased when we find the opposite relation of *incongruity* or *impropriety*.

If things connected be the subject of congruity, it is reasonable before-hand to expect, that a degree of congruity should be required proportioned to the degree of the connection. And upon examination we find this to hold in fact: where the relation is intimate, as between a cause and its effect, a whole and its parts, we require the strictest congruity; but where the relation is slight, or accidental, as among things jumbled together in the same place, we require little or no congruity: the strictest propriety is required in beha-

viour and manner of living; because a man is connected with these by the relation of cause and effect: the relation between an edifice and the ground it stands upon, is of the most intimate kind; and therefore the situation of a great house ought to be lofty; its relation to neighbouring hills, rivers, plains, being that of proximity only, demands but a small share of congruity: among members of the same club, the congruity ought to be considerable, as well as among things placed for show in the same niche: among passengers in a stage-coach, we require very little congruity; and less still at a public spectacle.

Congruity is so nearly allied to beauty, as commonly to be held a species of it; and yet they differ so essentially, as never to coincide: beauty, like colour, is placed upon a single subject; congruity upon a plurality: further, a thing beautiful in itself, may, with relation to other things, produce the strongest sense of incongruity.

Congruity and propriety are commonly reckoned synonymous terms; but they are distinguishable; and the precise meaning of each must be ascertained. Congruity is the genus, of which propriety is a species; for we call nothing *propriety*, but that congruity or suitableness which ought to subsist between sensible beings and their thoughts, words, and actions.

In order to give a full view of these secondary relations, we shall trace them through some of the most considerable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmost degree of congruity; even the slightest deviation is disgusting.

Examples of congruity and incongruity are furnished in plenty by the relation between a subject and its ornaments. A literary performance intended merely for amusement, is susceptible of much ornament, as well as a music-room or a play-house; for in gaiety, the mind hath a peculiar relish for show and decoration. The most gorgeous apparel, however improper in tragedy, is not unsuitable to opera-actors: the truth is, an opera, in its present form, is a mighty fine thing; but as it deviates from nature in its capital circumstances, we look not for nature nor propriety in those which are accessory. On other hand, a serious and important subject admits not much ornament; nor a subject that of itself is extremely beautiful: and a subject that fills the mind with its loveliness and grandeur, appears best in a dress altogether plain.

To a person of a mean appearance, gorgeous apparel is unsuitable; which, besides the incongruity, has a bad effect; for by contrast it shows the meanness of appearance in the strongest light. Sweetness of look and manner, requires simplicity of dress, joined with the greatest elegance. A stately and majestic air requires sumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of consummate beauty can bear to be highly adorned, and yet shows best in a plain dress:

For loveliness

Needs not the foreign aid of ornament,
But is when unadorn'd, adorn'd the most.

Thompson's *Autumn*, 208.

Congruity regulates not only the quantity of ornament, but also the kind. The ornaments that embellish

incongruity. A dancing-room ought to be all of them gay. No picture is proper for a church, but what has religion for its subject. All the ornaments upon a shield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the shield of Æneas to the military history of the Romans: but this beauty is overlooked by Homer; for the bulk of the sculpture upon the shield of Achilles, is of the arts of peace in general, and of joy and festivity in particular: the author of Telemachus betrays the same inattention, in describing the shield of that young hero.

In judging of propriety with regard to ornaments, we must attend, not only to the nature of the subject that is to be adorned, but also to the circumstances in which it is placed: the ornaments that are proper for a ball, will appear not altogether so decent at public worship; and the same person ought to dress differently for a marriage-feast and for a burial.

Nothing is more intimately related to a man, than his sentiments, words, and actions; and therefore we require here the strictest conformity. When we find what we thus require, we have a lively sense of propriety: when we find the contrary, our sense of impropriety is not less lively. Hence the universal distaste of affectation, which consists in making a shew of greater delicacy and refinement than is suited either to the character or circumstances of the person.

Congruity and propriety, where-ever perceived, appear agreeable; and every agreeable object produceth in the mind a pleasant emotion: incongruity and impropriety, on the other hand, are disagreeable; and of course produce painful emotions. These emotions, whether pleasant or painful, sometimes vanish without any consequence; but more frequently occasion other emotions, which we proceed to exemplify.

When any slight incongruity is perceived, in an accidental combination of persons or things, as of passengers in a stage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary existence, vaniseth without producing any effect. But this is not the case of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our esteem; when improper, we punish him with our contempt. Let us suppose, for example, a generous action suited to the character of the author, which raises in him and in every spectator the pleasant emotion of propriety: this emotion generates in the author both self-esteem and joy; the former when he considers his relation to the action, and the latter when he considers the good opinion that others will entertain of him: the same emotion of propriety produceth in the spectators esteem for the author of the action; and when they think of themselves, it also produceth, by means of contrast, an emotion of humility. To discover the effects of an unsuitable action, we must invert each of these circumstances: the painful emotion of impropriety generates in the author of the action both humility and shame; the former when he considers his relation to the action, and the latter when he considers what others will think of him: the same emotion of impropriety produceth in the spectators contempt for the author of the action; and it also produceth, by means of contrast, when they think of

themselves, an emotion of self-esteem. Here then *Congruity.* are many different emotions, derived from the same action considered in different views by different persons; a machine provided with many springs, and not a little complicated. Propriety of action, it would seem, is a chief favourite of nature, when such care and sollicitude is bestowed upon it. It is not left to our own choice; but, like justice, is required at our hands; and, like justice, is enforced by natural rewards and punishments: a man cannot, with impunity, do any thing unbecoming or improper; he suffers the chastisement of contempt inflicted by others, and of shame inflicted by himself. An apparatus so complicated, and so singular, ought to rouse our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human constitution is intended for some valuable purpose.

A gross impropriety is punished with contempt and indignation, which are vented against the offender by corresponding external expressions; nor is even the slightest impropriety suffered to pass without some degree of contempt. But there are improprieties, of the lighter kind, that provoke laughter; of which we have examples without end, in the blunders and absurdities of our own species: such improprieties receive a different punishment, as will appear by what follows. The emotions of contempt and of laughter occasioned by an impropriety of this kind, uniting intimately in the mind of the spectator, are expressed externally by a peculiar sort of laugh, termed a *laugh of derision or scorn*. An impropriety that thus moves not only contempt but laughter, is distinguished by the epithet of *ridiculous*; and a laugh of derision or scorn is the punishment provided for it by nature. Nor ought it to escape observation, that we are so fond of inflicting this punishment, as sometimes to exert it even against creatures of an inferior species: witness a turkeycock swelling with pride, and strutting with displayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of derision.

We must not expect, that these different improprieties are separated by distinct boundaries: for of improprieties, from the slightest to the most gross, from the most risible to the most serious, there are degrees without end. Hence it is, that in viewing some unbecoming actions, too risible for anger, and too serious for derision, the spectator feels a sort of mixt emotion, partaking both of derision and of anger; which accounts for an expression, common with respect to the impropriety of some actions, that we know not whether to laugh or be angry.

It cannot fail to be observed, that in the case of a risible impropriety, which is always slight, the contempt we have for the offender is extremely faint, though derision, its gratification, is extremely pleasant. This disproportion between a passion and its gratification, seems not conformable to the analogy of nature. In looking about for a solution, we must reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but also, by means of contrast, swells the good opinion we have of ourselves. This contributes, more than any other article, to the pleasure we have in ridiculing follies

Congruity. follies and absurdities; and accordingly, it is well known, that they who put the greatest value upon themselves are the most prone to laugh at others. Pride, which is a vivid passion, pleasant in itself, and not less so in its gratification, would singly be sufficient to account for the pleasure of ridicule, without borrowing any aid from contempt. Hence appears the reason of a noted observation, That we are the most disposed to ridicule the blunders and absurdities of others, when we are in high spirits; for in high spirits, self-conceit displays itself with more than ordinary vigour.

With regard to the final causes of congruity and impropriety; one, regarding congruity, is pretty obvious, that the sense of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with respect to quantity, coincides with proportion: when the parts of a building are nicely adjusted to each other, it may be said indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the same with proportion: a very long nose is disproportioned, but cannot be termed *improper*. In some instances, it is true, impropriety coincides with disproportion in the same subject, but never in the same respect; for example, a very little man buckled to a long Toledo: considering the man and the sword with respect to size, we perceive a disproportion; considering the sword as the choice of the man, we perceive an impropriety.

The sense of impropriety with respect to mistakes, blunders, and absurdities, is happily contrived for the good of mankind. In the spectators, it is productive of mirth and laughter, excellent recreation in an interval from business. But this is a trifle in respect of what follows. It is painful to be the subject of ridicule; and to punish with ridicule the man who is guilty of an absurdity, tends to put him more upon his guard in time coming. Thus even the most innocent blunder is not committed with impunity; because, were errors licensed where they do no hurt, inattention would grow into a habit, and be the occasion of much hurt.

The final cause of propriety as to moral duties, is of all the most illustrious. To have a just notion of it, the moral duties that respect others must be distinguished from those that respect ourselves. Fidelity, gratitude, and the forbearing injury, are examples of the first sort; temperance, modesty, firmness of mind, are examples of the other: the former are made duties by the sense of justice; the latter by the sense of propriety. Here is a final cause of the sense of propriety, that must rouse our attention. It is undoubtedly the interest of every man, to suit his behaviour to the dignity of his nature, and to the station allotted him by Providence; for such rational conduct contributes in every respect to happiness, by preserving health, by procuring plenty, by gaining

the esteem of others, and, which of all is the greatest blessing, by gaining a justly-founded self-esteem. But in a matter so essential to our well-being, even self-interest is not relied on: the powerful authority of duty is superadded to the motive of interest. The God of nature, in all things essential to our happiness, hath observed one uniform method: to keep us steady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally surrendered to so fallible a guide as is human reason. Propriety cannot rightly be considered in another light, than as the natural law that regulates our conduct with respect to ourselves; as justice is the natural law that regulates our conduct with respect to others. We call propriety a law, not less than justice; because both are equally rules of conduct that ought to be obeyed: propriety includes this obligation: for to say an action is proper, is, in other words, to say, that it *ought* to be performed; and to say it is improper, is, in other words, to say that it ought to be forborne. It is this very character of *ought* and *should* that makes justice a law to us, and the same character is applicable to propriety, though perhaps more faintly than to justice: but the difference is in degree only, not in kind; and we ought, without hesitation or reluctance, to submit equally to the government of both.

But it must, in the next place, be observed, that to the sense of propriety, as well as of justice, are annexed the sanctions of rewards and punishments; which evidently prove the one to be a law as well as the other. The satisfaction a man hath in doing his duty, joined with the esteem and good will of others, is the reward that belongs to both equally. The punishments also, though not the same, are nearly allied; and differ in degree more than in quality. Disobedience to the law of justice, is punished with remorse; disobedience to the law of propriety, with shame, which is remorse in a lower degree. Every transgression of the law of justice raises indignation in the beholder; and so doth every flagrant transgression of the law of propriety. Slighter improprieties receive a milder punishment: they are always rebuked with some degree of contempt, and frequently with derision. In general, it is true, that the rewards and punishments annexed to the sense of propriety, are slighter in degree than those annexed to the sense of justice: which is wisely ordered, because duty to others is still more essential to society, than duty to ourselves; for society could not subsist a moment, were individuals not protected from the headstrong and turbulent passion of their neighbours.

CONI, a strong town of Italy, in Piedmont, and capital of a territory of that name, with a good citadel. This town being divided into two factions, it surrendered to the French in 1641; but was restored to the duke of Savoy soon after. It is seated at the confluence of the rivers Gresse and Sture. E. Long. 7. 29. N. Lat. 44. 23.

ARE curve lines formed by the intersections of a cone and plane.

If a cone be cut by a plane through the vertex, the section will be a triangle ABC, Plate LXXIV. fig. 1.

If

SECT. I.
Plate
XXXIV.

Plate
LXXXIV.

If a cone be cut by a plane parallel to its base, the section will be a circle. If it be cut by a plane DEF, fig. 1. in such a direction, that the side AC of a triangle passing through the vertex, and having its base BC perpendicular to EF, may be parallel to DP, the section is a parabola; if it be cut by a plane DR, fig. 2. meeting AC, the section is an ellipse; and if it be cut by a plane DMO, fig. 3. which would meet AC extended beyond A, it is an hyperbola.

If any line HG, fig. 1. be drawn in a parabola perpendicular to DP, the square of HG will be to the square of EP, as DG to DP; for let LHK be a section parallel to the base, and therefore a circle, the rectangle LGK, will be equal to the square of HG, and the rectangle BPC equal to the square of EP; therefore these squares will be to each other as their rectangles; that is, as BP to LG, that is DP to DG.

SECT. I. Description of Conic Sections on a Plane.

1. PARABOLA.

"LET AB, fig. 4. be any right line, and C any point without it, and DKF a ruler, which let be placed in same plane in which the right line and point are, in such a manner that one side of it, as DK, be applied to the right line AB, and the other side KF coincide with the point C; and at F, the extremity of the side KF, let be fixed one end of the thread FNC, whose length is equal to KF, and the other extremity of it at the point C, and let part of the thread, as FG, be brought close to the side KF by a small pin G; then let the square DKF be moved from B towards A, so that all the while its side DK be applied close to the line BA, and in the mean time the thread being extended will always be applied to the side KF, being stoppt from going from it by means of the small pin; and by the motion of the small pin N there will be described a certain curve, which is called a *semi-parabola*.

"And if the square be brought to its first given position, and in the same manner be moved along the line AB, from B towards H, the other semi-parabola will be described."

The line AB is called the *directrix*; C, the focus; any line perpendicular to AB, a *diameter*; the point where it meets the curve, its *vertex*; and four times the distance of the vertex from the directrix, its *latus rectum* or *parameter*.

2. ELLIPSE.

"If any two points, as A and B, fig. 5. be taken in any plane, and in them are fixed the extremities of a thread, whose length is greater than the distance between the points, and the thread extended by means of a small pin C, and if the pin be moved round from any point until it return to the place from whence it began to move, the thread being extended during the whole time of the revolution, the figure which the small pin by this revolution describes is called an *ellipse*."

The points AB are called the *foci*; D, the *centre*; EF, the *transverse axis*; GH, the *lesser axis*; and any other line passing through D, a *diameter*.

3. HYPERBOLA.

"If to the point A, fig. 6. in any plane, one end

"of the rule AB be placed, in such a manner, that about that point, as a centre, it may freely move; and if to the other end B, of the rule AB, be fixed the extremity of the thread BDC, whose length is smaller than the rule AB, and the other end of the thread being fixed in the point C, coinciding with the side of the rule AB, which is in the same plane with the given point A; and let part of the thread, as BD, be brought close to the side of the rule AB, by means of a small pin D; then let the rule be moved about the point A, from C towards T, the thread all the while being extended, and the remaining part coinciding with the side of the rule being stoppt from going from it by means of the small pin, and by the motion of the small pin D, a certain figure is described which is called the *semi-hyperbola*."

The other semi-hyperbola is described in the same way, and the opposite HKF, by fixing the ruler to C, and the thread to A, and describing it in the same manner. A and C are called *foci*; the point G, which bisects AC, the *centre*; KE, the *transverse axis*; a line drawn through the centre meeting the hyperbolas, a *transverse diameter*; a line drawn through the centre, perpendicular to the transverse axis, and cut off by the circle MN, whose centre is E, and radius equal to CG, is called the *second axis*.

If a line be drawn through the vertex E, equal and parallel to the second axis GP and GO be joined, they are called *asymptotes*. Any line drawn through the centre, not meeting the hyperbolas, and equal in length to the part of a tangent parallel to it, and intercepted betwixt the asymptotes, is called a *second diameter*.

An ordinate to any section is a line bisected by a diameter and the abscissa, the part of the diameter cut off by the ordinate.

Conjugate diameters in the ellipse and hyperbola are such as mutually bisect lines parallel to the other; and a third proportional to two conjugate diameters is called the *latus rectum* of that diameter, which is the first in the proportion.

In the parabola, the lines drawn from any point to the focus are equal to perpendiculars to the directrix; being both equal to the part of the thread separated from the ruler.

In the ellipse, the two lines drawn from any point in the curve to the foci are equal to each other, being equal to the length of the thread; they are also equal to the transverse axis. In the hyperbola the difference of the lines drawn from any point to the foci is equal, being equal to the difference of the lengths of the ruler and thread, and is equal to the transverse axis.

From these fundamental properties all the others are derived.

The ellipse returns into itself. The parabola and hyperbola may be extended without limit.

Every line perpendicular to the directrix of a parabola meets it in one point, and falls afterwards within it; and every line drawn from the focus meets it in one point, and falls afterwards without it. And every line that passes through a parabola, not perpendicular to the directrix, will meet it again, but only once.

Every line passing through the centre of an ellipse

is bisected by it; the transverse axis is the greatest of all these lines; the lesser axis the least; and these nearer the transverse axis greater than those more remote.

In the hyperbola, every line passing through the centre, is bisected by the opposite hyperbola, and the transverse axis is the least of all these lines; also the second axis is the least of all the second diameters. Every line drawn from the centre within the angle contained by the asymptotes, meets at once, and falls afterwards within it; and every line drawn through the centre without that angle never meets it; and a line which cuts one of the asymptotes, and cuts the other extended beyond the centre, will meet both the opposite hyperbolas in one point.

If a line GM , fig. 4. be drawn from a point in a parabola perpendicular to the axis, it will be an ordinate to the axis, and its square will be equal to the rectangle under the abscissa MI and latus rectum; for, because GMC is a right angle, GM^2 is equal to the difference of GC^2 and CM^2 ; but GC is equal to GE , which is equal to MB ; therefore GM^2 is equal to $BM^2 - CM^2$; which, because CI and IB are equal, is (8 *Enc. 2.*) equal to four times the rectangle under MI and IB , or equal to the rectangle under MI and the latus rectum.

Hence it follows, that if different ordinates be drawn to the axis, their squares being each equal to the rectangle under the abscissa and latus rectum, will be to each other in the proportion of the abscissas, which is the same property as was shewn before to take place in the parabola cut from the cone, and proves those curves to be the same.

This property is extended also to the ordinates of other diameters, whose squares are equal to the rectangle under the abscissas and parameters of their respective diameters.

In the ellipse, the square of the ordinate is to the rectangle under the segments of the diameter, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is, LK^2 fig. 5. is to EKF as EF^2 to GH^2 .

In the hyperbola, the square of the ordinate is to the rectangle contained under the segments of the diameters betwixt its vertices, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is, SX^2 is to EXK as MN^2 to KE^2 .

Or if an ordinate be drawn to a second diameter, its square will be to the sum of the squares of the second diameter, and of the line intercepted betwixt the ordinate and centre, in the same proportion; that is, RZ^2 fig. 6. is to ZG^2 added to GM^2 , as KE^2 to MN^2 . These are the most important properties of the conic sections: and, by means of these, it is demonstrated, that the figures are the same described on a plane as cut from the cone; which we have demonstrated in the case of the parabola.

SECT. II. Equations of the Conic Sections

ARE derived from the above properties. The equation of any curve, is an algebraic expression, which

denotes the relation betwixt the ordinate and abscissa; the abscissa being equal to x , and the ordinate equal to y .

If p be the parameter of a parabola, then $y^2 = px$; which is an equation for all parabolas.

If a be the diameter of an ellipse, p its parameter; then $y^2 : ax - xx :: p : a$; and $y^2 = \frac{p}{a} \times ax - xx$; an equation for all ellipses.

If a be a transverse diameter of a hyperbola, p its parameter; then $y^2 : ax + xx :: p : a$, and $y^2 = \frac{p}{a} \times ax + xx$.

If a be a second diameter of an hyperbola, then $y^2 = \frac{p}{a} \times aa + xx :: p : a$; and $y^2 = \frac{p}{a} \times aa + xx$; which are equations for all hyperbolas.

As all these equations are expressed by the second powers of x and y , all conic sections are curves of the second order; and conversely, the locus of every quadratic equation is a conic section, and is a parabola, ellipse, or hyperbola, according as the form of the equation corresponds with the above ones, or with some other deduced from lines drawn in a different manner with respect to the section.

SECT. III. General Properties of Conic Sections.

A tangent to a parabola bisects the angle contained by the lines drawn to the focus and directrix; in an ellipse and hyperbola, it bisects the angle contained by the lines drawn to the foci.

In all the sections, lines parallel to the tangent are ordinates to the diameter passing through the point of contact; and in the ellipse and hyperbola, the diameters parallel to the tangent, and those passing through the points of contact, are mutually conjugate to each other. If an ordinate be drawn from a point to a diameter, and a tangent from the same point which meets the diameter produced; in the parabola, the part of the diameter betwixt the ordinate and tangent will be bisected in the vertex; and in the ellipse and hyperbola, the semi-diameter will be a mean proportion betwixt the segments of the diameter betwixt the centre and ordinate, and betwixt the centre and tangent.

The parallelogram formed by tangents drawn through the vertices of any conjugate diameters, in the same ellipse or hyperbola, will be equal to each other.

SECT. IV. Properties peculiar to the Hyperbola.

As the hyperbola has some curious properties arising from its asymptotes, which appear at first view almost incredible, we shall briefly demonstrate them.

1. The hyperbola and its asymptotes never meet; if not, let them meet in S , fig. 6.; then by the property of the curve the rectangle KXE is to SX^2 as GE^2 to GM^2 or EP^2 ; that is, as GK^2 to SX^2 ; wherefore, KXE will be equal to the square of GK ; but the rectangle KXE , together with the square of GE , is also equal to the square of GK ; which is absurd.

2. If a line be drawn through a hyperbola parallel to its second axis, the rectangle, by the segments of that

Plate
LXXXIV.Plate
LXXXIV.

that line, betwixt the point in the hyperbola and the asymptotes, will be equal to the square of the second axis.

For if SZ , fig. 6. be drawn perpendicular to the second axis, by the property of the curve, the square of MG , that is, the square of PE , is to the square of GE , as the squares of ZG and the square of MG together, to the square of SZ or GX : and the squares of RX and GX are in the same proportion, because the triangles RXG , PEG are equiangular; therefore the squares ZG and MG are equal to the square of RX ; from which, taking the equal squares of SX and ZG , there remains the rectangle RSV , equal to the square of MG .

3. Hence, if right lines be drawn parallel to the second axis, cutting an hyperbola and its asymptotes, the rectangles contained betwixt the hyperbola and points where the lines cut the asymptotes will be equal to each other; for they are severally equal to the square of the second axis.

4. If from any points, d and S , in a hyperbola, there be drawn lines parallel to the asymptotes da SQ and Sb dc , the rectangle under da and dc will be equal to the rectangle under QS and Sb ; also the parallelograms da , Gc , and SQ gb , which are equiangular, and consequently proportional to the rectangles, are equal.

For draw YW RV parallel to the second axis, the rectangle Yd W is equal to the rectangle RSV ; wherefore, WD is to SV as RS is to dY . But because the triangles RQS , AYD , and GSV cd W , are equiangular, Wd is to SV as cd to Sb , and RS is to dY as SQ to da ; wherefore, dc is to Sb as SQ to da ; and the rectangle dc , da , is equal to the rectangle QS , Sb .

5. The asymptotes always approach nearer the hyperbola.

For, because the rectangle under SQ and Sb or QG , is equal to the rectangle under da and dc , or AG , and QG is greater than aG ; therefore ad is greater than QS .

6. The asymptotes come nearer the hyperbola than any assignable distance.

Let X be any small line. Take any point, as d , in the hyperbola, and draw da , dc , parallel to the asymptotes; and as X is to da , so let aG be to GQ . Draw QS parallel to aG , meeting the hyperbola in S , then QS will be equal to X . For the rectangle SQ gb will be equal to the rectangle da G ; and consequently SQ is to da as AG to GQ .

If any point be taken in the asymptote below Q , it can easily be shown that its distance is less than the line X .

SECT. V. Areas contained by Conic Sections.

THE area of a parabola is equal to $\frac{2}{3}$ the area of a circumscribed parallelogram.

The area of an ellipse is equal to the area of a circle

whose diameter is a mean proportional betwixt its latus rectum and the square of its axis.

If two lines, a d and QS , be drawn parallel to one of the asymptotes of an hyperbola, the space a QS d , bounded by these parallel lines, the asymptotes and the hyperbola will be equal to the logarithm of a Q , whose module is a d , supposing a G equal to unity.

SECT. VI. Curvature of Conic Sections.

THE curvature of any conic section, at the vertices of its axis, is equal to the curvature of a circle whose diameter is equal to the parameter of its axis.

If a tangent be drawn from any other point of a conic section, the curvature of the section in that point will be equal to the curvature of a circle to which the same line is a tangent, and which cuts off from the diameter of the section, drawn through the point, a part equal to its parameter.

SECT. VII. Uses of Conic Sections.

ANY body, projected from the surface of the earth, describes a parabola, to which the direction wherein it is projected is a tangent; and the distance of the directrix is equal to the height from which a body must fall to acquire the velocity wherewith it is projected: hence the properties of the parabola are the foundation of gunnery.

All bodies acted on by a central force, which decreases as the square of the distances increases, and impressed with any projectile motion, making any angle with the direction of the central force, must describe conic sections, having the central force in one of the foci, and will describe parabolas, ellipses, and hyperbolas, according to the proportion betwixt the central and projectile force. This is proved by direct demonstration.

The great principle of gravitation acts in this manner; and all the heavenly bodies describe conic sections having the sun in one of the foci; the orbits of the planets are ellipses, whose transverse and lesser diameters are nearly equal; it is uncertain whether the comets describe ellipses with very unequal axes, and so return after a great number of years; or whether they describe parabolas and hyperbolas, in which case they will never return.

SECT. VIII. Uses of Conic Sections in the Solution of Geometrical Problems.

MANY problems can be solved by conic sections that cannot be solved by right lines and circles. The following theorems, which follow from the simpler properties of the sections, will give a specimen of this.

A point equally distant from a given point and a given line, is situated in a given parabola.

A point, the sum of whose distances from two given points is given, is situated in a given ellipse.

A point, the difference of whose distances from two given points is given, is situated in a given hyperbola.

CON

CONICHTHYODONTES, or PLECTRONITE, in natural history, one of the three names the fossil teeth of fishes are known by.

CON

CONIFERÆ, in botany, an order of plants in the *fragmenta methodi generalis* of Linnaeus, containing the following genera, viz. cupressus, ephedra, equisetum, juniperus,

Coniferous juniperus, pinus, taxus, thuja.

Conium.

CONIFEROUS TREES, such as bear hard dry seed-vessels of a conical figure; consisting of several woody parts, being mostly fleshy, adhering closely together, and separating when ripe.

CONINGSECK, a town of Suabia in Germany, and capital of a county of the same name. E. Long. 9. 23. N. Lat. 47. 50.

CONJOINT, in a general sense, signifies, united or connected.

CONJOINT *Degrees*, in music, two notes which follow each other immediately in the order of the scale, as *ut* and *re*.

CONJOINT *Tetrachords*, two tetrachords, or fourths, where the same chord is the highest of one, and the lowest of the other.

CONISSALÆ, in natural history, a class of fossils naturally and essentially compounded, not inflammable, nor soluble in water, found in detached masses, and formed of crystalline matter debased by earth.

Of this class there are two orders, and of each of these only one genus. Conissalæ of the first order are found in form of a naturally regular and uniform powder; all the genuine particles of which are nearly of one determinate shape, appearing regularly concreted, and not fragments of others once larger. Conissalæ of the second order are found in form of a rude, irregular, and shapeless powder, the particles of which are never of any determinate figure, but seem broken fragments of once larger masses.

To the former genus belong the different kinds of sand; and to the latter the *saburæ*, or grits.

CONJUGATE DIAMETER, or *Axis*, of an *Ellipsis*, the shortest of the two diameters, or that bisecting the axis.

CONJUGATE *Hyperbolas*. See CONIC SECTIONS, sect. i. 3.

CONJUGATION, in grammar, a regular distribution of the several inflexions of verbs in their different voices, moods, tenses, numbers and persons, so as to distinguish them from one another. See GRAMMAR, n° 25. and LANGUAGE, n° 19, &c.

CONIUM, HEMLOCK, a genus of the *digynia* order, belonging to the pentandria class of plants. The species are three; 1. *The maculatum*, or *greater hemlock*, grows naturally on the sides of banks and roads in many parts of Britain. It is a biennial plant which perishes after it has ripened its seeds. It hath a long taper root like a parsnip, but smaller. The stalk is smooth, spotted with purple, and rises from four to upwards of six feet high; branching out toward the top into several smaller stalks, garnished with decomposed leaves, whose lobes are cut at the top into three parts; these are of a lucid green, and have a disagreeable smell. The stalks are terminated by umbels of white flowers, each being composed of about 10 rays or small umbels, and have a great number of flowers, which spread open, each sitting upon a distinct footstalk; the seeds are small and channelled, and like those of aniseed. It flowers in June, and the seeds ripen in autumn. 2. *The tenuifolium*, with striated seeds, differs from the first in having taller stalks, which are not so much spotted. The leaves are much narrower, and of a paler green; and this difference

is constant. It is a biennial plant, and grows naturally in Germany. 3. *The africanum*, with prickly seeds, is a native of the Cape of Good Hope. The plant rarely grows above nine inches high; the lower leaves are divided like those of the small wild rue, and are of a greyish colour; those upon the stalk are narrower, but of the same colour; these are terminated by umbels of white flowers, each of the larger umbels being composed of three small ones; the involucre hath three narrow leaves situated under the umbel. This flowers in July, and ripens seed in autumn, soon after which the plants decay.

Medicinal Uses. The first species is sometimes used as a discutient; and for this purpose is an ingredient in some plasters. It has generally been accounted poisonous when taken internally; and certainly is so when taken in a large quantity. Dr Stork, however, found, that in small doses it may be taken with great safety; and that without disordering the constitution, or even producing any sensible operation, it sometimes proves a powerful resolvent in many obdurate disorders.

CONJUNCT, in a general sense, signifies conjoined, concurrent, or united.

CONJUNCT *Rights*, in Scots law. See LAW, Part III. n° clxxx. 15, &c.

CONJUNCT, or *Confident Persons*, in Scots law. Ibid. n° clxxxiii. 8.

CONJUNCTION, in astronomy, the meeting of two or more stars or planets in the same degree of the zodiac.

CONJUNCTION, in grammar, an indeclinable word or particle, which serves to join words and sentences together, and thereby shews their relation or dependence upon one another. See GRAMMAR, n° 70.

CONJUNCTIVA, in anatomy. See there n° 406. b.

CONJURATION, magic words, characters, or ceremonies, whereby evil spirits, tempests, &c. are supposed to be raised, or driven away. The Romish priests pretend to expel devils, by preparing holy water in a particular manner, and sprinkling it over the possessed, with a number of conjurations, and exorcisms. See EXORCISM.

Some authors make the difference between conjuration and witchcraft to consist in this; that the former effects its end by prayers, and invocation of God's name, &c. to compel the devil to do what is desired; so that the conjurer is supposed to be at war with the devil, and that evil spirit to act merely out of constraint: whereas the latter attains its end by an immediate application to the devil himself; and the devil's complaisance is supposed to be the consequence of some compact between them, so that the devil and the witch have a good understanding together. Both these, again, differ from enchantment and sorcery; in that these latter operate secretly, and slowly, by spells, charms, &c. without ever calling on the devil, or having any conference with him.

CONNAUGHT, one of the four provinces of Ireland, bounded on the east by that of Leinster, on the west by the ocean, on the north and north-west by part of the ocean and province of Ulster, and on the south and east by Munster. It is about 130 miles in length, and 84 in breadth. It has no rivers of any great

great note, besides the Shannon. It has several convenient bays and creeks, and is fertile in many places. It had several dangerous bogs, over-run with woods, which are now in some measure cleared away. This province produces abundance of cattle, sheep, deer, hawks and honey; but the inhabitants being lazy, it is the least cultivated of all the four provinces. It contains one archbishopric, 5 bishoprics, 6 counties, 7 market-towns, 8 places of trade, 10 boroughs that send members to parliament, 47,256 houses, 24 old castles, besides fortresses that have been erected of late, and 330 parishes. The principal town is Galway.

CONNARUS, *CEYLON SUMACH*; a genus of the decandria order, belonging to the monodelphia class of plants. There is but one species, *viz.* the monocarpus. This is a native of India, and rises with a ligneous stalk eight or ten feet high, which is hard, rigid, and covered with a black bark, and divides upward into two or three branches garnished with trifoliate leaves, having long footstalks placed alternate. It is propagated by cuttings, and is to be treated in the same manner with other tender exotics.

CONNECTION, or CONNEXION, the relation or dependence of one thing upon another.

CONNECTION, or *Continuity*, in the drama, consists in the joining of the several scenes together.

The connection is said to be observed, when the scenes of an act succeed one another immediately, and are so joined as that the stage is never left empty.

CONNECTIVES, in grammar. See GRAMMAR, n° 69.

CONNIVENT VALVES, in anatomy, those wrinkles, cellules and valvules, which are found in the inside of the two intestines ileum and jejunum. See ANATOMY, n° 354, g, h.

CONNOISSEUR, a French word much used of late in English, to signify a person well skilled in any thing: whence it is used for a critic, or one who is a thorough judge upon any subject.

CONNOR (Bernard), a learned physician, was born in the county of Kerry, in Ireland, about the year 1666. Having determined to apply himself to the study of physic, he went to France, and resided some time in the university of Montpellier. Afterwards he went to Paris; where he obtained great skill in medicine, anatomy, and chemistry. From thence he travelled to Venice, with the two sons of the high-chancellor of Poland; and then taking a tour through great part of Germany, went to Warsaw, where he was made physician to king John Sobieski. In 1695, he came to England, read a course of lectures in London and Oxford, and became member of the Royal Society and College of Physicians; afterwards, being invited to Cambridge, he read public lectures there, and made various experiments in chemistry. He has rendered himself memorable for a philosophical and medical treatise in Latin, entitled, *Evangelium Medici*, i. e. "the Physician's Gospel;" tending to explain the miracles performed by Christ, as natural events, upon the principles of natural philosophy. He wrote also a history of Poland; and died in 1698, aged 32.

CONNOR, a city of Ireland, in the county of

Antrim and province of Ulster. W. Long. 6. 30. Conocarpus N. Lat. 54. 50.

CONOCARPUS, *BUTTON-WOOD*; a genus of the monogynia order, belonging to the pentandria class of plants. There are two species, the erecta and procumbens, both natives of the West Indies. They rise to the height of about 16 feet, but are trees of no beauty, nor is the wood of them used for any mechanic purpose in the countries where they grow naturally. They are, however, preserved in some botanic gardens in Britain, for the sake of variety.

CONOID, in geometry, a solid body, generated by the revolution of a conic section about its axis. See CONIC SECTIONS.

CONOIDES, in anatomy, a gland found in the third ventricle of the brain, called *pinealis*, from its resemblance to a pine-apple. See ANATOMY, n° 397, c.

CONON, the renowned Athenian general and admiral, flourished 394 years before Christ. See ATTICA, n° 162, 163. After his defeat by Lyfander, he fled to Evagoras king of Cyprus: after which he put himself under the protection of Artaxerxes king of Persia; with whose army he delivered Athens from the oppression of strangers, and rebuilt its walls. In the 360th year of Rome, he beat the Lacedaemonians in a sea-fight near Cnidus upon the coast of Asia, deprived them of the sovereign rule they had on sea ever since the taking of Athens, and had some other considerable advantages over them: but falling into the hands of Teribazus a Persian, who envied his glory, he was put to death.

CONQUEST, in a general sense; acquisition by victory; any thing gained.

Heir of CONQUEST, in Scots law. See LAW, Part III. n° clxxx. 6.

CONRAD II. elected emperor of Germany in 1004. He was obliged to take the field against most of the German dukes who had revolted from him; and he put Ernest duke of Suabia under the ban of the empire. This being one of the earliest instances of such a prohibition, the formula is inserted here for its singularity. "We declare thy wife a widow, thy children orphans; and we send thee, in the name of the devil, to the four corners of the world." It was in the reign of this prince that the the German fiefs became hereditary. He died in 1039.

CONRAD III. emperor of Germany in 1138. The duke of Bavaria opposed his election, and being put under the ban of the empire, and deprived of his duchy, he could not sur vive his disgrace. The margrave of Austria was ordered by the emperor to take possession of Bavaria; but Welfi, uncle to the deceased duke, attacked him, and was defeated near the castle of Winburgh: the battle fought upon this occasion is famous in history, as having given rise to the party-names of Guelphs and Gibbelines, afterwards assumed in Italy. The parole of the day with the Bavarians was *Welfi*, from the name of their general; that of the Imperialists *Werlingen*, from a small village where Frederic duke of Suabia, their commander, had been nursed: by degrees these names served to distinguish the two parties; and the Italians, who could not accustom themselves to such rough words, formed from them their Guelphs and Gibbelines. He died in 1152.

CONRAD

Conrad I Confanguinity. CONRAD of Lichtenau, or Abbas Uspergensis, was author of an universal Chronology from the creation to 1229, continued by an anonymous writer to Charles V. He collected a fine library, and died about the year 1240.

CONRADIN, or CONRAD junior, son of Conrad IV. was acknowledged emperor by the Gibbelines, who received him in triumph at Rome: but pope Alexander IV. had published a crusade against this orphan; and Urban VII. his successor, gave the empire to Charles of Anjou, brother to Louis IX. king of France; and the unfortunate youth, though powerfully supported, even by the Turks, lost a battle, in which he was taken prisoner, and was beheaded, by order of his base opponent, publicly, at Naples in 1229, in the 18th year of his age. In him ended the race of the dukes of Suabia, which had produced several kings and emperors.

CONFANGUINITY, or KINDRED, is defined by the writers on these subjects to be, *vinculum personarum ab eodem stipite descendunt*; "the connection or relation of persons descended from the same stock or common ancestor." This confanguinity is either lineal or collateral.

Lineal confanguinity is that which subsists between persons of whom one is descended in a direct line from the other; as between John Stiles (the *propositus* in the table of confanguinity) and his father, grandfather, great-grandfather, and so upwards in the direct ascending line; or between John Stiles and his son, grandson, great-grandson, and so downwards in the direct descending line. Every generation, in this direct lineal confanguinity, constitutes a different degree, reckoning either upwards or downwards: the father of John Stiles is related to him in the first degree, and so likewise is his son; his grandfire and grandson, in the second; his great-grandfire and great-grandson, in the third. This is the only natural way of reckoning the degrees in the direct line; and therefore universally obtains, as well in the civil and canon, as in the common law.

The doctrine of lineal confanguinity is sufficiently plain and obvious; but it is, at the first view, astonishing to consider the number of lineal ancestors which every man has, within no very great number of degrees: and so many different bloods is a man said to contain in his veins, as he hath lineal ancestors. Of these he hath two in the first ascending degree; his own parents: he hath four in the second; the parents of his father, and the parents of his mother: he hath eight in the third, the parents of his two grandfathers, and of his two grandmothers: and, by the same rule of progression, he hath 128 in the seventh; 1024 in the tenth; and at the 20th degree, or the distance of 20 generations, every man hath above a million of ancestors, as common arithmetic will demonstrate*. This lineal confanguinity, we may observe, falls strictly within the definition of "vinculum personarum ab eodem stipite descendunt"; since lineal relations are such as descend one from the other, and both of course from the same common ancestor.

Collateral kindred answers to the same description: collateral relations agreeing with the lineal in this, that they descend from the same stock or ancestor; but differing in this, that they do not descend the one from the other. Collateral kinsmen, then, are such as lineally spring from one and the same ancestor, who is the *stirps*, or "root," the *stipes*, "trunk," or common stock, from whence these relations are branched out. As if John Stiles hath two sons, who have each a numerous issue: both these issues are lineally descended from John Stiles as their common ancestor; and they are collateral kinsmen to each other, because they are all descended from this common ancestor, and all have a portion of his blood in their veins, which denominates them *confanguineous*.

We must be careful to remember, that the very being of collateral confanguinity consists in this descent from one and the same common ancestor. Thus Titius and his brother are related; why? because both are derived from one father: Titius and his first cousin are related; why? because both descend from the same

* This will seem surprising to those who are unacquainted with the increasing power of progressive numbers; but is palpably evident from the following table of a geometrical progression, in which the first term is 2, and the denominator also 2: or, to speak more intelligibly, it is evident, for that each of us has two ancestors in the first degree, the number of whom is doubled at every remove; because each of our ancestors has also two immediate ancestors of his own.

A shorter way of finding the number of ancestors at any even degree, is by squaring the number of ancestors at half that number of degrees. Thus, 16, the number of ancestors at 4 degrees, is the square of 4, the number of ancestors at two; 256 is the square of 16; 65,536 of 256; and the number of ancestors at 40 degrees would be the square of 1,048,576, or upwards of a million of millions.

confanguinity.

same grandfather; and his second cousin's claim to confanguinity is this; that they are both derived from one and the same great-grandfather. In short, as many ancestors as a man has, so many common stocks he has, from which collateral kinsmen may be derived. And as we are taught by holy writ, that there is one couple of common ancestors belonging to us all, from whom the whole race of mankind is descended, the obvious and undeniable consequence is, that all men are in some degree related to one another. For, indeed, if we only suppose each couple of our ancestors to have left, one with another, two children; and each of those children to have left, on an average, two more; (and, without such a supposition, the human species must be daily diminishing); we shall find that all of us have now subsisting near 270 millions of kindred in the 15th degree, at the same distance from the several common ancestors as we ourselves are; besides those that are one or two degrees nearer to or farther from the common stock, who may amount to as many more *. And if this calculation should appear incompatible with the number of inhabitants on the earth, it is because, by intermarriages among the several descendants from the same ancestor, a hundred, or a thousand modes of confanguinity may be consolidated in one person; or he may be related to us a hundred, or a thousand different ways.

The method of computing these degrees in the canon law, which we have adopted, is as follows. We begin at the common ancestor, and reckon downwards; and in whatsoever degree the two persons, or the most remote of them is distant from the common ancestor, that is the degree in which they are related to each other. Thus, Titius and his brother are related in the first degree; for from the father to each of

them is counted only one: Titius and his nephew are related in the second degree; for the nephew is two degrees removed from the common ancestor, viz. his own grandfather, the father of Titius: or (to give a more illustrious instance from the English annals) king Henry VII. who slew Richard III. in the battle of Bosworth, was related to that prince in the fifth degree. Let the *propositus* therefore, in the table of confanguinity, represent king Richard III. and the class marked *z*, king Henry VII. Now their common stock or ancestor was king Edward III. the *abavus* in the same table: from him to Edmund duke of York, the *proavus* is one degree; to Richard earl of Cambridge, the *avus*, two; to Richard duke of York, the *pater*, three; to king Richard III. the *propositus*, four; and from king Edward III. to John of Gant (*A*) is one degree; to John Earl of Somerset (*s*) two; to John, duke of Somerset (*c*) three; to Margaret countess of Richmond (*d*) four; to king Henry VII. (*e*) five. Which last mentioned prince, being the farthest removed from the common stock, gives the denomination to the degree of kindred in the canon and municipal law. Though according to the computation of the civilians (who count upwards from either of the persons related, to the common stock, and then downwards again to the other; reckoning a degree for each person both ascending and descending) these two princes were related in the ninth degree: for from king Richard III. to Richard duke of York, is one degree; to Richard earl of Cambridge, two; to Edmund duke of York, three; to king Edward III. the common ancestor, four; to John of Gant, five; to John earl of Somerset, six; to John duke of Somerset, seven; to Margaret countess of Richmond, eight; to king Henry VII. nine. See the Table of Confanguinity,

Confanguinity.

* This will swell more considerably than the former calculation: for here, though the first term is but 1, the denominator is 4; that is, there is one kinsman (a brother) in the first degree, who makes, together with the *propositus*, the two descendants from the first couple of ancestors; and in every other degree, the number of kindred must be the *quadruple* of those in the degree which immediately precedes it. For, since each couple of ancestors has two descendants which increase downwards, must be double to that in which the ancestors increase upwards; but we have seen that the ancestors increase in a duplicate ratio: therefore the descendants must increase in a double duplicate; that is, in a quadruple ratio.

Collateral Degrees. Number of Kindred.

1	1
2	4
3	16
4	64
5	256
6	1024
7	4096
8	16384
9	65536
10	262144
11	1048576
12	4194304
13	16777016
14	67108864
15	268435456
16	107371824
17	4294967296
18	17179869184
19	68719476736
20	27487796944

This calculation may also be formed by a more compendious process, viz. by squaring the couples, or half the number of ancestors at any given degree; which will furnish us with the number of kindred we have in the same degree, at equal distance with ourselves from the common stock, besides those at unequal distances. Thus, in the tenth lineal degree, the number of ancestors is 1024; its half, or the couples, amount to 512; the number of kindred in the tenth collateral degree amounts therefore to 262144, or the square of 512. And if we will be at the trouble to recollect the state of the several families within our own knowledge, and observe how far they agree with this account; that is, whether, on an average, every man has not one brother or sister, four first-cousins, sixteen second-cousins, and so on; we shall find that the present calculation is very far from being overcharged.

Conangu-
linity
↓
Consent.

guinity, (Plate LXXXVIII. fig. 10.) wherein all the degrees of collateral kindred to the *propositus* are computed, as far as the tenth of the civilians, and the seventh of the canonists inclusive; the former being distinguished by the numeral letters, the latter by the common ciphers.

CONANGUINITY and *Affinity*, (degrees of) forbidden in marriage. See MARRIAGE; and LAW, Part III. N° clx. 4.

CONANGUINITY and *Affinity*, an objection against a judge. See LAW, Part III. N° clvi. 12. Against a witness, *ibid.* clxxxiv. 12.

CONSCIENCE, a secret testimony of the soul, whereby it gives its approbation to things that are naturally good, and condemns those that are evil. See MORAL *Philosophy*, N° 85, 86.

Courts of CONSCIENCE, are courts for recovery of small debts, constituted by act of parliament in London, Westminster, &c. and other populous and trading districts.

CONSCRIPT, in Roman antiquity, an appellant given to the senators of Rome, who were called *conscript fathers*, on account of their names being all entered in one register.

CONSECRATION, the act of devoting any thing to the service and worship of God. The Mosaic law ordained, that all the first-born, both of man and beast, should be sanctified or consecrated to God. We find also, that Joshua consecrated the Gibeonites, as Solomon and David did the Nethinims, to the service of the temple; and that the Hebrews sometimes consecrated their fields and cattle to the Lord, after which they were no longer in their power.

Among the ancient Christians, the consecration of churches was performed with a great deal of pious solemnity. In what manner it was done for the three first ages, is uncertain; the authentic accounts reaching no higher than the fourth, when, in the peaceable reign of Constantine, churches were every where built, and dedicated with great solemnity. Some think the consecration consisted in setting up the sign of the cross, or in placing a communion-table in the church; and others, that no more was done than preaching a panegyric sermon in commemoration of the founder, and that then they proceeded to prayers, one of which was composed on purpose for the church to be consecrated. The Romanists have a great deal of pious foppery in the ceremonies of consecration; which they bestow on almost every thing, as bells, candles, books, water, oil, ashes, palms, swords, banners, pictures, crosses, agnus-dei's, roses, childrens clouts, &c.

In England, churches have been always consecrated with particular ceremonies, the form of which was left to the discretion of the bishop. That observed by bishop Laud, in consecrating St Catherine Creed church, in London, gave great offence.

CONSECRATION is particularly used for the benediction of the elements in the eucharist.

CONSENT, in a general sense, denotes much the same with ASSENT.

CONSENT of *Parts*, in the animal œconomy, an agreement or sympathy, whereby when one part is immediately affected, another at a distance becomes affected in the same manner. See SYMPATHY.

CONSEQUENCE, in logic, the conclusion, or what results from reason or argument. See CONCLUSION.

The consequence is that other proposition in which the extremes or premises of a syllogism are joined, or separated; and is gained from what was asserted in the premises.

This word, in a more restrained sense, is used for the relation or connection between two propositions, whereof one is inferred from the other.

CONSEQUENT, something deduced or gathered from a former argumentation. But, in a more precise sense, it is used for the proposition which contains the conclusion, considered in itself, without any regard to the antecedent: in which sense the consequent may be true, though the consequence be false. See the preceding article.

CONSERVATOR, an officer ordained for the security and preservation of the privileges of some cities and communities, having a commission to judge of and determine the differences among them.

CONSERVATORY, a term sometimes used for a green-house or ice-house.

CONSERVE, in pharmacy, a form of medicine contrived to preserve the flowers, herbs, roots, or fruits of several simples, as near as possible to what they are when fresh gathered. See PHARMACY, n° 454, &c.

CONSIGNMENT, in law, the depositing any sum of money, bills, papers, or commodities, in good hands; either by appointment of a court of justice, in order to be delivered to the persons to whom they are adjudged; or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are designed for.

CONSIGNMENT of *Goods*, in commerce, is the delivering or making them over to another: thus, goods are said to be consigned to a factor, when they are sent to him to be sold, &c.; or when a factor sends back goods to his principal, they are said to be consigned to him.

CONSISTENCE, in physics, that state of a body wherein its component particles are so connected or entangled among themselves, as not to separate or recede from each other. It differs from continuity in this, that it implies a regard to motion or rest, which continuity does not, it being sufficient to denominate a thing continuous that its parts are contiguous to each other.

CONSISTENTES, in church-history, a kind of penitents who were allowed to assist at prayers, but who could not be admitted to receive the sacrament.

CONSISTORY (*Consistorium*), signifies as much as *prætorium*, a tribunal: it is commonly used for a council-house of ecclesiastical persons, or place of justice in the spiritual court; a session or assembly of prelates. And every archbishop and bishop of every diocese hath a consistory court held before his chancellor or commissary in his cathedral church, or other convenient place of his diocese, for ecclesiastical causes. The bishop's chancellor is the judge of this court, supposed to be skilled in the civil and canon law; and in places of the diocese far remote from the bishop's consistory, the bishop appoints a commissary to judge in all causes within

Conse-
quence
↓
Consistory.

within a certain district, and a register to enter his decrees, &c.

CONSISTORY, at Rome, is an ecclesiastical assembly held in the presence of the pope, for the reception of princes or their ambassadors, for the canonization of saints, for the promotion of cardinals, and other important affairs.

CONSOLE, in architecture, an ornament cut upon the key of an arch, which has a projecture, and, on occasion, serves to support little corniches, figures, bowls, and vases.

CONSOLIDATION, in law, the combining and uniting two benefices into one. The term is borrowed from the civil law; where it properly signifies an union of the possession, or occupation, with the property. Thus, if a man have by legacy *usum fructum fundi*, and afterwards buy the property, or fee-simple, of the heir; this is called a *consolidation*.

CONSOLIDATION, in medicine, the action of uniting broken bones, or the lips of wounds, by means of *consolidating remedies*, as they are called; which cleansing with a moderate heat and force, taking corruption out of the wounds, and preserving the temperature of the parts, cause the nourishment to be fitly applied to the part affected.

Among the many instances of the consolidating power of blood and raw flesh, we have a very remarkable one in Bartholine's Medical Observations. A man being condemned to have his nose cut off by the hand of the common executioner, the friends, who were to be present, provided a new loaf of warm bread, which was cut in the middle, and the nose received in it as it fell from the face: the nose was after this nicely placed on the face again; and, being sewed on, the whole in time consolidated, and left no other marks of the ignominy than the scar round the whole nose, and the traces of the stitches.

CONSONANCE, in music. See **INTERVAL**.

CONSONANT, a letter that cannot be sounded without some single or double vowel before or after it; as *b, c, d*, &c.

CONSPIRACY, in law, signifies an agreement between two or more, falsely to indict, or procure to be indicted, an innocent person, of felony.

CONSPIRATORS are, by statute, defined to be such as bind themselves by oath, covenant, or other alliance, to assist one another falsely and maliciously to indict persons, or falsely to maintain pleas.

Conspirators in treason, are those that plot against the king and the government.

CONSTABLE, according to some, is a Saxon word, compounded of *coning*, "king," and *staple*, which signifies the "stay or support of the king." But as we borrowed the name as well as the office of *constable* from the French, Sir William Blackstone is rather inclined to deduce it, with Sir Henry Spelman and Dr Cowel, from that language; wherein it is plainly derived from the Latin *comes stabuli*, an officer well known in the empire; so called, because, like the great constable of France, as well as the lord high constable of England, he was to regulate all matters of chivalry, tilts, tournaments, and feats of arms, which were performed on horseback. This great office of Lord High Constable hath been disused in

England, except only on great and solemn occasions, as the king's coronation, and the like, ever since the attainder of Stafford duke of Buckingham under king Henry VIII.; as in France it was suppressed about a century after by an edict of Lewis XIII.: but from his office, says Lambard, this lower constableness was at first drawn and fetched, and is, as it were, a very finger of that hand. For the statute of Winchester, which first appoints them, directs, that for the better keeping of the peace, two constables, in every hundred and franchise, shall inspect all matters relating to arms and armour.

Constables are of two sorts; high constables, and petty constables. The former were first ordained by the statute of Winchester as before mentioned; and are appointed at the court-leets of the franchise or hundred over which they preside; or, in default of that, by the justices at their quarter-sessions; and are removeable by the same authority that appoints them. The petty constables are inferior officers in every town and parish, subordinate to the high constable of the hundred, first instituted about the reign of Edward III. These petty constables have two offices united in them, the one ancient, and the other modern. Their ancient office is that of head-borough, tithing-man, or borholder; who are as ancient as the time of king Alfred: their more modern office is that of constable merely; which was appointed so lately as the reign of Edward III. in order to assist the high constable. And in general the ancient head-boroughs, tithing-men, and borholders, were made use of to serve as petty constables; though not so generally, but that in many places they still continue distinct officers from the constables. They are all chosen by the jury at the court-leet; or if no court-leet be held, are appointed by two justices of the peace.

The general duty of all constables, both high and petty, as well as of the other officers, is to keep the king's peace in their several districts; and to that purpose they are armed with very large powers of arresting, and imprisoning, of breaking open houses, and the like: of the extent of which powers, considering what manner of men are for the most part put upon these offices, it is perhaps very well that they are generally kept in ignorance. One of their principal duties arising from the statute of Winchester, which appoints them, is to keep watch and ward in their respective jurisdictions. Ward, guard, or *custodia*, is chiefly intended of the day-time, in order to apprehend rioters, and robbers on the highways; the manner of doing which is left to the discretion of the justices of the peace, and the constable: the hundred being, however, liable for all the robberies committed therein by day-light, for having kept negligent guard. Watch is properly applicable to the night only, (being called among the Saxons *wach* or *waſſen*); and it begins when ward ends, and ends when that begins: for, by the statute of Winchester, in walled towns the gates shall be closed from sun-setting to sun-rising; and watch shall be kept in every borough and town, especially in the summer season, to apprehend all rogues, vagabonds and night-walkers, and make them give an account of themselves. The constable may appoint watchmen at his discretion, regulated by the

Constables custom of the place; and these, being his deputies, have, for the time being, the authority of their principal.

There are also constables denominated from particular places, as constable of the Tower, of Dover castle, of Windsor castle, of the castle of Caernarvon, and many other of the castles of Wales; whose office is the same with that of the castellani, or governors of castles.

CONSTABLE of *Scotland*. See *LAW*, Part III. clviii. 15.

CONSTABLES to *Justices of the Peace*, in Scots law, are the proper officers for executing their orders. They have powers to suppress tumults, and to apprehend delinquents and those who can give no good account of themselves, and carry them to the next justice.

CONSTANCE, a strong town of Germany, in the circle of Suabia, with a bishop's see, whose bishop is a prince of the empire. It has a handsome bridge, and several fine structures, as well faced as profane. It carries on a great trade, and is well fortified; and though it pretends to be an imperial town, the Austrians keep a garrison here. It is famous for a council held here in 1514, when there were three popes; but they were all deposed, and Martin V. was elected in their room. The council caused Jerom of Prague to be burnt, though the emperor Sigismund had given him a safe conduct; in pursuance of this maxim, "that no faith is to be kept with heretics." They likewise condemned the doctrine of Wickliff, and ordered his bones to be burned 40 years after he was dead. However, the inhabitants now are Protestants. It is seated on a lake of the same name. E. Long. 9. 12. N. Lat. 47. 35.

CONSTANCE, a great lake of Germany, between Suabia and Switzerland. It is 30 miles in length, and 8 in breadth. It is crossed by the river Rhine; and there are several towns on its banks.

CONSTANTINA, a strong and considerable town of Africa, in the kingdom of Algiers, and capital of a territory of the same name. It is the largest and strongest place in all the eastern parts; and it is seated on the top of a great rock. There is no way to it but by steps cut out of the rock; and the usual way of punishing criminals here is to throw them down the cliff. Here are a great many Roman antiquities, particularly a triumphal arch. E. Long. 7. 12. N. Lat. 36. 4.

CONSTANTINA, a town of Spain, in Andalusia, and capital of a small territory of the same name, with a castle seated on a mountain. W. Long. 5. 35. N. Lat. 37. 40.

CONSTANTINE, a kingdom of Barbary of that name, in Africa. It is bounded on the north by the Mediterranean, on the east by the kingdom of Tunis, on the south by Bildulgerid, and on the west by the river Sufegmar, which separates it from the kingdom of Bugia. The country is the new Numidia of the ancients, and had its own king; but it is now a province to Algiers.

CONSTANTINE the Great, the first emperor of the Romans who embraced Christianity. His father, Constantinus Chlorus, rendered himself famous by his victorious expeditions to Germany and Britain: upon the

abdication of Diocletian, he shared the Roman empire with Galerius Maximinus in 305, and was at that time at York, where he died in 306; having first caused his son Constantine the Great to be proclaimed emperor by his army, and by the English. Galerius at first refused to admit Constantine to his father's share in the imperial throne; but after having lost several battles, he consented in 308. Maxentius, who succeeded Galerius, opposed him: but was defeated, and drowned himself in the Tyber. The senate then declared Constantine, *chief or first* augustus, and Licinius his second associate in the empire in 313. These princes published an edict, in their joint names, in favour of the Christians; but soon after Licinius, jealous of Constantine's renown, conceived an implacable hatred against him, and renewed the persecutions against the Christians. This brought on a rupture between the emperors; and a battle, in which Constantine was victorious. A short peace ensued: but Licinius having shamefully violated the treaty, the war was renewed; when Constantine totally defeating him, he fled to Nicomedia, where he was taken prisoner and strangled in 323. Constantine, now become sole master of the western and eastern empires, immediately formed the plan of establishing Christianity as the religion of the state; for which purpose, he convoked several ecclesiastical councils: but finding he was likely to meet with great opposition from the Pagan interest at Rome, he conceived the design of founding a new city, to be the capital of his Christian empire; see CONSTANTINOPLE. The glory Constantine had acquired by establishing the Christian religion, was tarnished by the part he took in the persecutions carried on by the Arians, towards the close of his reign, against their Christian brethren who differed from them: seduced by Eusebius of Nicomedia, he banished several eminent prelates; soon after which, he died in 337, the 66th year of his age, and 31st of his reign.

As to the character of Constantine, he was chaste, pious, laborious and indefatigable; a great general, successful in war, and deserving his success by his shining valour and by the brightness of his genius; a protector of arts, and an encourager of them by his beneficence. If we compare him with Augustus, we shall find that he ruined idolatry, by the same precautions and the same address that the other used to destroy liberty. Like Augustus, he laid the foundation of a new empire; but less skillful, and less polite, he could not give it the same stability: he weakened the body of the state by adding to it, in some measure, a second head in the foundation of Constantinople; and transporting the centre of motion and strength too near the eastern extremity, he left without heat, and almost without life, the western parts, which soon became a prey to the barbarians. The Pagans were too much his enemies to do him justice. Eutropius says, that in the former part of his reign he was equal to the most accomplished princes, and in the latter to the meanest. The younger Victor, who makes him to have reigned more than 31 years, pretends that in the first 10 years he was a hero; in the 12 succeeding ones a robber; and in the 10 last a spendthrift. It is easy to perceive, with respect to these two reproaches

Constantine of Victor's, that the one relates to the riches which Constantine took from idolatry, and the other to those with which he loaded the church.

CONSTANTINE emperor of the East in 1002, left the care of the empire to his wife Helena, who loaded the people with taxes, and fold all the offices in church and state to the highest bidders; while the emperor employed himself in reading, writing, and the fine arts, till he became as good an architect and painter, as he was a bad prince: he wrote several biographical and geographical works, which would have done honour to his name, if he had not neglected his duty to compile them. He died in 959.

CONSTANTINE (Dracofes), the son of Emmanuel Paleologus, was placed on the throne by sultan Amurath in 1448. But Mahomet II. his successor, resolving to dethrone him, laid siege to Constantinople by sea and land, and took it by assault in 1453, after it had held out 85 days. The unfortunate emperor seeing the Turks enter the breaches, threw himself into the midst of the enemy, and was cut to pieces; the children of the imperial house were massacred by the soldiers; and the women reserved to gratify the lust of the conqueror: and thus terminated the dynasty of the Constantines, 1123 years after its establishment at Constantinople.

CONSTANTINE (Robert), a learned physician born at Caen, taught polite literature in that city; and acquired great reputation by his skill in the Greek language, in history, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are esteemed.

Removing the imperial seat to this city the cause of the decline of the western empire.

CONSTANTINOPLE, the modern name of the city of BYZANTIUM in Thrace. It was enlarged and beautified by the Roman emperor Constantine the Great, in the year 330. At the same time he transferred thither the seat of the empire; and this removal is generally thought to have been one of the principal causes of the sudden decline of the western empire after this period.

In the year 332, the Sarmatians implored Constantine's assistance against the Goths, who had made an irruption into their territories, and destroyed every thing with fire and sword. The emperor readily granted their request, and gained a complete victory. Near 100,000 of the enemy perished, either in the battle, or after it with hunger and cold. In consequence of this overthrow, the Goths were obliged to sue for peace; but the ungrateful Sarmatians no sooner found themselves delivered from their enemies, than they turned their arms against their benefactor, and ravaged the provinces of Media and Thrace. The emperor, receiving intelligence of this treachery, returned with incredible expedition, cut great numbers of them in pieces, and obliged the rest to submit to what terms he was pleased to impose.

Is highly
respected.

Constantine seems to have been a prince very highly respected, even by far distant nations. In 333, according to Eusebius, ambassadors arrived at Constantinople from the Blemys, Indians, Ethiopians, and Persians, courting his friendship. They were received in a most obliging manner; and learning from the ambassadors of Sapor king of Persia, that there were great numbers of Christians in their master's dominions,

Constantine wrote a letter in their behalf to the Persian monarch.

Next year, the Sarmatians being again attacked by the Goths, found themselves obliged to set at liberty and arm their slaves against them. By this means they indeed overcame the Goths; but the victorious slaves turning their arms against their masters, drove them out of the country. This misfortune obliged them to the number of 300,000 to apply for relief to the Roman emperor, who incorporated with his legions such as were capable of service; and gave settlements to the rest in Thrace, Scythia, Macedon, and Italy. This was the last remarkable action of Constantine the Great. He died on May 25th 337, having divided the empire among his children and nephews, in the following manner. Constantine, his eldest son, had Gaul, Spain, and Britain; Constantius, the second, had Asia, Syria, and Egypt; and Constans, the youngest, Illyricum, Italy, and Africa. To his nephew Dalmatius, he gave Thrace, Macedon, and Achaia; and to king Anibalbanus, his other nephew, Armenia Minor, Pontus, Cappadocia, and the city of Cæsarea, which he desired might be the capital of his kingdom.

After the death of Constantine, the army and senate proclaimed his three sons emperors, without taking any notice of his two nephews, who were soon after murdered, with Julius Constantius the late emperor's brother, and all their friends and adherents. Thus the family of Constantine was at once reduced to his three sons, and two nephews, Gallus and Julian, the sons of Julius Constantius : and of these the former owed his life to a malady, from which no one thought he could recover; and the latter to his infancy, being then at most about seven years of age. The three brothers divided among themselves the dominions of the deceased princes; but did not long agree together. In 340, Constantine having in vain solicited Constantius to yield part of Italy to him, raised a considerable army; and under pretence of marching to the assistance of his brother Constantius, who was then at war with the Persians, made himself master of several places in Italy. Hereupon, Constantius detached part of his army against him; and Constantine, being drawn into an ambuscade near Aquileia, was cut off with his whole forces. His body was thrown into the river Ansa; but being afterwards discovered, was sent to Constantinople, and interred there near the tomb of his father.

By the defeat and death of his brother, Constant remained sole master of all the western part of the empire, in the quiet possession of which he continued till the year 350. This year, Magnentius, the son of one Magnus, a native of Germany, finding Constant despised by the army on account of his indolence and inactivity, resolved to murder him, and set up for himself. Having found means to gain over the chief officers of the army to his designs, he seized on the Imperial palace at Autun, and distributed among the populace what sums he found there; which induced not only the city, but the neighbouring country, to espouse his cause. But Constant being informed of what had passed, and finding himself unable to resist the usurper, fled towards Spain. He was overtaken, however, by Galio whom Magnentius had sent after him with a

chosen body of troops, who dispatched with many wounds the unhappy prince at Helena, a small village situated near the foot of the Pyrenees.

Thus Constantius acquired a right to the whole Roman empire; though one half of it was seized by Magnentius after the murder of Constantians. The former had been engaged in a war with the Persians, in which little advantage was gained on either side; but the Persians now giving no more disturbance, the emperor marched against the usurpers in the west. Besides Magnentius, there were at this time two other pretenders to the western empire. Veterano, general of the foot in Pannonia, had, on the first news of the death of Constantians, caused himself to be proclaimed emperor by the legions under his command. He was a native of Upper Mesia, and advanced in years when he usurped the sovereignty; but so illiterate, that he then first learned to read. The third pretender was Flavius Popilius Nepotianus, son of Eutropia the sister of Constantine the Great. Having assembled a company of gladiators and men of desperate fortunes, he assumed the purple on the third of June 350, and in that attire presented himself before the gates of Rome. The prefect Anicetus, who commanded there for Magnentius, sallied out against him with a body of Romans; who were soon driven back into the city. Soon after Nepotianus made himself master of the city itself, which he filled with blood and slaughter. Magnentius being informed of what had happened, sent against this new competitor his chief favourite and prime minister Marcellinus. Nepotianus received him with great resolution; a bloody battle ensued between the soldiers of Magnentius and the Romans who had espoused the cause of Nepotianus; but the latter being betrayed by a senator, named *Heracitus*, his men were put to flight, and he himself killed, after having enjoyed the sovereignty only 28 days. Marcellinus ordered his head to be carried on the point of a lance through the principal streets of the city; put to death all those who had declared for him; and under pretence of preventing disturbances, commanded a general massacre of all the relations of Constantine. Soon after, Magnentius himself came to Rome to make the necessary preparations for resisting Constantius, who was exerting himself to the utmost in order to revenge the death of his brother. In the city he behaved most tyrannically, putting to death many persons of distinction, in order to seize their estates; and obliged the rest to contribute half of what they were worth towards the expence of the war. Having by this means raised great sums, he assembled a mighty army composed of Romans, Germans, Gauls, Franks, Britons, Spaniards, &c. At the same time, however, dreading the uncertain issues of war, he dispatched ambassadors to Constantius with proposals of accommodation. Constantius set out from Antioch about the beginning of autumn; and, passing through Constantinople, arrived at *Heraclea*, where he was met by the deputies from Magnentius, and others from Veterano, who had agreed to support each other in case the emperor would hearken to no terms. The deputies of Magnentius proposed in his name a match between him and Constantia, or rather Constantina, the sister of Constantius, and widow of Annibalianus; offering, at

the same time, to Constantius the sister of Magnentius. At first the emperor would hearken to no terms; but afterwards, that he might not have to oppose two enemies at once, concluded a separate treaty with Veterano, by which he agreed to take him for his partner in the empire. But when Veterano ascended the tribunal along with Constantius, the soldiers pulled him down from thence, crying out that they would acknowledge no other emperor than Constantius alone. On this Veterano threw himself at the emperor's feet, and implored his mercy. Constantius received him with great kindness, and sent him to Prusia in Bithynia, where he allowed him a maintenance suitable to his quality.

Constantius, now master of all Illyricum, and of the army commanded by Veterano, resolved to march against Magnentius without delay. In the mean time, however, on advice that the Persians were preparing to invade the Eastern provinces, he married his sister Constantina to his cousin-german Gallus; created him Cæsar on the 15th of March; and allotted him for his share not only all the East, but likewise Thrace and Constantinople. About the same time Magnentius gave the title of Cæsar to his brother Decentius, whom he dispatched into Gaul to defend that country against the Barbarians who had invaded it; for Constantius had not only stirred up the Franks and Saxons to break into that province by promising to relinquish to them all the places they should conquer, but had sent them large supplies of men and arms for that purpose. On this encouragement the barbarians invaded Gaul with a mighty army, overthrew Decentius in a pitched battle, committed every where dreadful ravages, and reduced the country to a most deplorable situation. In the mean time Magnentius having assembled a numerous army, left Italy, and crossing the Alps, advanced into the plains of Pannonia, where Constantius, whose main strength consisted in cavalry, was waiting for him. Magnentius, hearing that his competitor was encamped at a small distance, invited him by a messenger to the extensive plains of *Sciscia* on the Save, there to decide which of them had the best title to the empire. This challenge was by Constantius received with great joy; but as his troops marched towards Sciscia in disorder, they fell into an ambuscade, and were put to flight with great slaughter. With this success, Magnentius was so elated, that he rejected all terms of peace which were now offered by Constantius; but after some time, a general engagement ensued at *Mursa*, in which Magnentius was entirely defeated, with the loss of 24,000 men. Constantius, though victor, is said to have lost 30,000, which seems improbable. All authors, however, agree, that the battle of *Mursa* proved fatal to the western empire, and greatly contributed to its speedy decline.

After his defeat at *Mursa*, Magnentius retired into Italy, where he recruited his shattered forces as well as he could. But the beginning of the following year 352, Constantius, having assembled his troops, surprised and took a strong castle on the Julian Alps, belonging to Magnentius, without the loss of a man. After this the emperor advanced in order to force the rest; upon which Magnentius was struck with such terror, that

Tyranny of Gallus.

that he immediately abandoned Aquileia, and ordered the troops that guarded the other passes of the Alps to follow him. Thus Constantius entering Italy without opposition, made himself master of Aquileia. From thence he advanced to Pavia, where Magnentius gained a considerable advantage over him. Notwithstanding this loss, however, Constantius reduced the whole country bordering on the Po, and Magnentius's men deserted to him in whole troops, delivering up to him the places they had garrisoned; by which the tyrant was so disheartened, that he left Italy, and retired with all his forces into Gaul. Soon after this, Africa, Sicily, and Spain, declared for Constantius; upon which Magnentius sent a senator, and after him some bishops, to treat of a peace; but the emperor treated the senator as a spy, and sent back the bishops without any answer.—Magnentius now finding his affairs desperate, and that there were no hopes of pardon, recruited his army in the best manner he could, and dispatched an assassin into the East to murder Gallus Cæsar; hoping that his death would oblige the emperor to withdraw his forces from Gaul, and march in person to the defence of the Eastern provinces, which were threatened by the Persians. The assassin gained over some of Gallus's guards; but the plot being discovered before it could be put in execution, they were all seized and executed as traitors.

23
Magnentius attempts to get Gallus murdered.

24
Magnentius defeated a second time, kills all his family and himself.

In 353, the war against Magnentius was carried on with more vigour than ever, and at last happily ended by a battle fought in the higher Dauphiny. Magnentius, being defeated, took shelter in Lyons; but the few soldiers who attended him, despairing of any further success, resolved to purchase the emperor's favour by delivering up to him his rival, the author of so calamitous a war. Accordingly they surrounded the house where he lodged; upon which the tyrant, in despair, flew with his own hand his mother, his brother Desiderius whom he had created Cæsar, and such of his friends and relations as were with him; and then, fixing his sword in a wall, threw himself upon it, in order to avoid a more shameful death which he had reason to apprehend.

After the death of Magnentius, his brother Decentius Cæsar, who was marching to his assistance, and had already reached Sens, finding himself surrounded on all sides by the emperor's forces, chose rather to strangle himself than fall alive into the hands of his enemies. Thus Constantius was left sole master of the Roman empire. His panegyricists tell us, that after his victory he behaved with the greatest humanity, forgiving and receiving into favour his greatest enemies; but other historians differ considerably from them, and tell us that Constantius now became haughty, imperious, and cruel, of which many instances are given.

25
Constantius sole master of the empire.

26
Many grievous calamities.

This year the empire was subjected to very grievous calamities. Gaul was ravaged by the barbarians beyond the Rhine, and the disbanded troops of Magnentius. At Rome, the populace rose on account of a scarcity of provisions. In Asia, the Issaurian robbers over-ran Lycæonia and Pamphylia; and even laid siege to Seleucia, a city of great strength; which, however, they were not able to make themselves masters of. At the same time, the Saracens committed dread-

ful ravages in Mesopotamia, the Persians also invaded the province of Anthemusia on the Euphrates. But the Eastern provinces were not so much harried by the barbarians as by Gallus Cæsar himself, who ought to have protected them. That prince was naturally of a cruel, haughty, and tyrannical disposition; but being elated with his successes against the Persians, he at last behaved more like a tyrant and a madman than a governor. His natural cruelty is said to have been heightened by the indignations of his wife Constantina, who is by Ammianus styled the *Megeia*, or "fury of her sex;" and he adds, that her ambition was equal to her cruelty. Thus all the provinces and cities in the East were filled with blood and slaughter. No man, however innocent, was sure to live or enjoy his estate a whole day; for Gallus's temper being equally suspicious and cruel, those who had any private enemies took care to accuse them of crimes against the state, and with Gallus it was the same thing to be accused and condemned. At last the emperor being informed from all quarters of the evil conduct of his brother-in-law, and being at the same time told that he aspired to the sovereignty, resolved upon his ruin. For this end he wrote letters to Gallus and Constantina, inviting them both into Italy. Though they had both sufficient reason to fear the worst, yet they durst not venture to disobey the emperor's express command. Constantina, who was well acquainted with her brother's temper, and hoped to pacify him by her artful insinuations, set out first, leaving Gallus at Antioch; but she had scarce entered the province of Bithynia, when she was seized with a fever which put an end to her life. Gallus now despairing of being able to appease his sovereign, thought of openly revolting; but most of his friends deserted him on account of his inconsistent and cruel temper, so that he was at last obliged to submit to the pleasure of Constantius. He advanced therefore, according to his orders; but at Pætavius was arrested, and stripped of all the ensigns of his dignity. From thence he was carried to *Fianona*, now *Fianone* in Dalmatia, where he was examined by two of his most inveterate enemies. He confessed most of the crimes laid to his charge; but urged as an excuse the evil counsels of his wife Constantina. The emperor, provoked at this plea which reflected on his sister, and instigated by the enemies of Gallus, signed a warrant for his execution, which was performed accordingly.

28
He is put to death.

All this time the emperor had been engaged in a war with the Germans: he had marched against them in person; and though he gained no advantage, the barbarians thought proper to make peace with him. This, however, was but short-lived. No sooner was the Roman army withdrawn, than they began to make new inroads into the empire. Against them Constantius dispatched Arbeto with the flower of the army; but he fell into an ambushade, and was put to flight with the loss of a great number of men. This loss, however, was soon retrieved by the valour of *Arintheus*, who became famous in the reign of Valens, and of two other officers, who falling upon the Germans, without waiting the orders of their general, put them to flight, and obliged them to leave the Roman territories.

The tranquillity of the empire, which ensued on this

29
War with the Germans.

Constantinopolitan history. 30
Sylvanus betrayed by Arbeto.

this repulse of the Germans, was soon interrupted by a pretended conspiracy, by which in the end a true one was produced. Sylvanus, a leading man among the Franks, commanded in Gaul, and had there performed great exploits against the barbarians. He had been raised to this post by Arbeto; but only with a design to remove him from the emperor's presence, in order to accomplish his ruin, which he did in the following manner. One *Dynames*, keeper of the emperor's mules, leaving Gaul, begged of Sylvanus letters of recommendation to his friends at court; which being granted, the traitor eraled all but the subscription. He then inserted directions to the friends of Sylvanus for the carrying on a conspiracy; and delivering these forged letters to the prefect Lamprius, they were by him shewed to the emperor. Thus Sylvanus was forced to revolt, and cause himself to be proclaimed emperor by the troops under his command. In the mean time, however, Dynames having thought proper to forge another letter, the fraud was discovered, and an inquiry set on foot, which brought to light the whole matter. Sylvanus was now declared innocent, and letters sent to him by the emperor confirming him in his post; but these were scarce gone, when certain news arrived at court of Sylvanus having revolted, and caused himself to be proclaimed emperor. Constantius, thunderstruck at this news, dispatched against him Ursicinus, an officer of great integrity, as well as valour and experience in war; who forgetting his former character, pretended to be Sylvanus's friend, and thus found means to cut him off by treachery.

Is murdered.

32
Gaul ravaged by the barbarians.

33
Julian created Cæsar.

The barbarians, who had been hitherto kept quiet by the brave Sylvanus, no sooner heard of his death, than they broke into Gaul with greater fury than ever. They took and pillaged above forty cities, and among the rest Cologne, which they levelled with the ground. At the same time the Quadi and Sarmatians entering Pannonia, destroyed every thing with fire and sword. The Persians also, taking advantage of the absence of Ursicinus, over-ran, without opposition, Armenia and Mesopotamia; Prosper and Mausolus, who had succeeded that brave commander in the government of the East, being more intent upon pillaging than defending the provinces committed to their care. Constantius, not thinking it advisable to leave Italy himself, resolved at last to raise his cousin Julian, the brother of Gallus, to the dignity of Cæsar. Julian seems to have been a man of very extraordinary talents; for though before this time he had been entirely buried in obscurity, and conversed only with books, no sooner was he put at the head of an army than he behaved with the same bravery, conduct and experience, as if he had been all his life bred up to the art of war. He was appointed governor of Gaul; but before he set out, Constantius gave him in marriage his sister Helena, and made him many valuable presents. At the same time, however, the jealous emperor greatly limited his authority; gave him written instructions how to behave; ordered the generals who served under him to watch all his actions no less than those of the enemy; and strictly enjoined Julian himself not to give any largesses to the soldiery.

Julian set out from Milan on the 1st of December

355, the emperor himself accompanying him as far as Pavia, from whence he pursued his journey to the Alps, attended only by 360 soldiers. On his arrival at Turin he was first acquainted with the loss of Cologne, which had been kept concealed from the emperor. He arrived at Vienne before the end of the year, and was received by the people of that city and the neighbourhood with extraordinary joy.

In 356, the barbarians besieged *Autun*; to relieve which place, Julian marched with what forces he could raise. When he came there he found the siege raised; on which he went in pursuit of the barbarians to Auxerre, crossing with no small danger thick woods and forests, from Auxerre to *Troies*. On his march he was surrounded on all sides by the barbarians, who moved about the country in great bodies; but he put them to flight with an handful of men, cut great numbers of them in pieces, and took some prisoners. From Troies he hastened to Rheims, where the main body of the army, commanded by Marcellus, waited his arrival. Leaving Rheims, he took his route towards Decempagi, now *Dieuze*, on the Scille in Lorraine, with a design to oppose the Germans who were busy in ravaging that province. But the enemy attacking his rear unexpectedly, would have cut off two legions, had not the rest of the army, alarmed at the sudden noise, turned back to their assistance. A few days afterwards he defeated the Germans, though with great loss to his own army; the victory, however, opened him a way to Cologne. This city he found abandoned by the barbarians. They had neglected to fortify it: but Julian commanded the ancient fortifications to be repaired with all possible expedition, and the houses to be rebuilt; after which he retired to Sens, and there took up his winter-quarters. This year also Constantius entered Germany on the side of Rætia, laid waste the country far and wide; and obliged the barbarians to sue for peace, which was readily granted. The same year he enacted two laws; by one of which it was declared capital to sacrifice, or pay any kind of worship, to idols; the other, granting the effects of condemned persons to belong to their children and relations within the third degree, except in cases of magic and treason; but this last one he revoked two years after.

In the beginning of the year 357, the barbarians besieged Julian a whole month in Sens; Marcellus, the commander in chief, never once offering to assist him. Julian, however, so valiantly defended himself with the few forces he had, that the barbarians at last retired. After this, Constantius declared Julian commander in chief of all the forces in Gaul; appointing under him one *Severus*, an officer of great experience, and of a quite different disposition from Marcellus. On his arrival in Gaul, Julian received him with great joy, raised new troops, and supplied them with arms which he luckily found in an old arsenal. The emperor, resolved at all events to put a stop to the terrible devastations committed by the barbarous nations, chiefly by the Alemans, wrote to Julian to march directly against them. At the same time he sent Barbatio, who had been appointed general in place of Sylvanus, with a body of 25 or 30,000 men, out of Italy, in order to inclose the enemy between two armies.

38 The Leti cut off by Julian.

39 He forces the barbarians to abandon the islands of the Rhine.

43 Entirely defeats them at Strasbourg

41 He enters Germany and concludes a truce with the barbarians.

The Leti, however, a German nation, passing between the armies, advanced as far as Lyons, hoping to surprise that wealthy city; but meeting with a warmer reception than they expected, contented themselves with ravaging the country all round it. On the first notice of this expedition, Julian detached strong parties to guard the passages through which he knew the barbarians must return. Thus they were all cut off except those who marched near the camp of Barbatio; who was so far from cutting off their retreat, that he complained by a letter to Constantius of some officers for attempting it. These officers, among whom was Valentinian afterwards emperor of the West, were, by the orders of Constantius, cashiered for their disobedience. The other barbarians either fortified themselves in the countries which they had seized, stopping up all the avenues with huge trees, or took shelter in the islands formed by the Rhine. Julian resolved first to attack the latter; and with this view demanded some boats of Barbatio: but he, instead of complying with his just request, immediately burnt all his boats, as he did on another occasion the provisions which had been sent to both armies, after he had plentifully supplied his own. Julian, not in the least disheartened with this unaccountable conduct, persuaded some of the most resolute of his men to wade over to one of the islands. Here they killed all the Germans who had taken shelter in it. They then seized their boats, and pursued the slaughter in several other islands, till the enemy abandoned them all, and retired to their respective countries with their wives and what booty they could carry. On their departure, Barbatio attempted to lay a bridge of boats over the Rhine; but the enemy, apprised of his intention, threw a great number of huge trees into the river, which being carried by the stream against the boats, sunk several of them, and parted the rest. The Roman general then thought proper to retire; but the barbarians falling unexpectedly upon him in his retreat, cut great numbers of his men in pieces, took most of his baggage, laid waste the neighbouring country, and returned in triumph loaded with booty. Elated with this success, they assembled in great numbers under the command of *Chnodomarius*, a prince of great renown among them, and six other kings. They encamped in the neighbourhood of Strasbourg. Here they were encountered by Julian; who put them to flight, with the loss of 6 or 8000 of their men slain in the field, and a vastly greater number drowned in the river; while Julian himself lost only 243 private men, and 4 tribunes. In this action *Chnodomarius* was taken, and sent to Rome, where he soon after died.

After the battle, Julian advanced with all his army to *Magenae*, where he built a bridge over the Rhine and entered Germany, having with difficulty prevailed upon his army to follow him. Here he ravaged the country till the time of the autumnal equinox, when being prevented by snow from advancing any further, he began to repair the fort of Trajan, by some supposed to be the castle of Cromburgh, about three or four leagues from Frankfort. The barbarians were now so much alarmed, that they sent deputies to treat of a peace; but this Julian refused to grant them upon

any terms. He consented, however, to a truce for seven months, upon their promising to store with provisions the fort he was building in their country. This year Constantius made some remarkable laws. By one he punished with confiscation such as renounced the Christian for the Jewish religion; and, by another addressed to Felix bishop of Rome, he exempted all merchandizing ecclesiastics, with their wives, children, and domestics, from every imposition ordinary and extraordinary; supposing the gains they made to be applied by them to the relief of the poor.

In 358, as soon as the season was fit for action, Julian took the field against the Franks, with a design to conquer them before the truce he had concluded with the Alemans was expired. The Franks were at that time divided into several tribes, the most powerful of which were the Sali and Chamavi. The first of these sent deputies, intreating that he would suffer them to remain as friends to the empire in the country they possessed. But Julian, without paying any regard to this deputation, entered their country, and obliged them to submit; after which he allotted them lands in Gaul, incorporating great numbers of them into his cavalry. He next marched against the Chamavi, whom he defeated and obliged to retire beyond the Rhine. Afterwards he rebuilt three forts on the river Meuse, which had been destroyed by the barbarians; but wanting provisions in a country so often ravaged, he ordered 6 or 800 vessels to be built in Britain for the conveying corn from thence into Gaul. Julian continued in the country of the Chamavi till the expiration of his truce with the Alemans; and then laying a bridge of boats over the Rhine, he entered their country, putting all to fire and sword. At last two of their kings came in person to him to sue for peace: which Julian granted, upon their promising to set at liberty the captives they had taken; to supply a certain quantity of corn when required; and to furnish wood, iron, and carriages, for repairing the cities they had ruined. The prisoners whom he at this time released, amounted to upwards of 20,000.

Soon after the vernal equinox of this year 358, Constantius marched in person against the Quadi and Sarmatians, whose country lay beyond the Danube. Having crossed that river on a bridge of boats, he laid waste the territories of the Sarmatians; who thereupon came in great numbers, together with the Quadi, pretending to sue for peace. Their true design was to surprise the Romans; but the latter suspecting it, fell upon them sword in hand, and cut them all in pieces. This obliged the rest to sue for peace in good earnest, which was granted on the delivery of hostages. The emperor then marched against the *Limigantes*, that is, the slaves who, in 334, had driven the Sarmatians out of their country, and seized it for themselves*. They used the same artifice as the Sarmatians and Quadi had done, coming in great numbers under pretence of submitting, but prepared to fall upon him unexpectedly if opportunity offered. The emperor, observing their sly looks, and distrusting them, caused his troops surround them insensibly while he was speaking. The *Limigantes* then displeased with the conditions he offered them, laid their hands on their swords; on which they were attacked by the Roman soldiers. Finding

it impossible to make their escape, they made with great fury towards the tribunal, but were repelled by the guards forming themselves into a wedge, and every one of them cut in pieces. After this, the emperor ravaged their country to such a degree, that they were in the end obliged to submit to the only condition he thought proper to allow them, which was to quit their country and retire to a more distant place. The country was then restored to the Sarmatians who were its original possessors.

This year is also remarkable for a very haughty embassy from Sapor king of Persia. The ambassador, named *Narfer*, brought a letter, in which the Persian monarch styled himself "king of kings, brother of the sun and moon," &c. He acquainted the emperor that he might lawfully insist on having all the countries beyond the river *Strymon* in *Macedon* delivered up to him; but lest his demands should seem unreasonable, he would be contented with *Armenia* and *Mesopotamia*, which had been most unjustly taken from his grandfather *Narfer*. He added, that unless justice was done him, he was resolved to assert his right by force of arms. This letter was presented to *Constantius* wrapped up in a piece of white silk; but he, without entering into any negotiation with the ambassador, wrote a letter to *Sapor*, in which he told him, that as he had maintained the Roman dominions in their full extent, when he was possessed only of the East, he could not suffer them to be curtailed now when he was master of the whole empire. In a few days, however, he sent another letter with rich presents; being very desirous at least to put off the war till he had secured the northern provinces against the incursions of the barbarians, that he might then employ all the forces of the empire against so formidable an enemy. This embassy proved unsuccessful, as did also another which was sent soon after. The last ambassadors were imprisoned as spies, but afterwards dismissed unhurt. By a law of *Constantius* dated in 358, all magicians, augurs, astrologers, and pretenders to the art of divination, were declared enemies to mankind; and such of them as were found in the court either of the emperor or of *Julian*, he commanded to be put to the torture, and specified what torments they were to undergo.

In 359, *Julian* continued his endeavours for relieving the province of *Gaul*, which had suffered so much from the incursions of the barbarians. He erected magazines in different places, visited the cities which had suffered most, and gave orders for repairing their walls and fortifications properly. He then crossed the *Rhine*, and pursued the war in *Germany* with great success, inasmuch that the barbarians submitted to such terms as he pleased to impose. In the mean time the emperor, having received intelligence that the *Limigantes* had quitted the country in which he had placed them, hastened to the banks of the *Danube*, in order to prevent their entering *Pannonia*. On his arrival he sent deputies desiring to know what had induced them to abandon the country which had been allotted them. The *Limigantes* answered, in appearance with the greatest submission imaginable, that they were willing to live as true subjects of the empire in any other place; but that the country he had allotted

them was quite uninhabitable, as they could demonstrate if they were but allowed to cross the river, and lay their complaints before him. This request was granted; but while he attended his tribunal, the barbarians unexpectedly fell upon his guards sword in hand, killed several of them, and the emperor with difficulty saved himself by flight. The rest of the troops, however, soon took the alarm, and surrounding the *Limigantes*, cut them all off to a man. This year *Constantius* instituted a court of inquisition against all those who consulted heathen oracles. *Paulus Catena*, a noted and cruel informer, was dispatched into the East to prosecute them; and *Modestus*, then count of the East, and equally remarkable for his cruelty, was appointed judge. His tribunal was erected at *Scythopolis* in *Palestine*, whither persons of both sexes, and of every rank and condition, were daily dragged in crowds from all parts, and either confined in dungeons, or torn in pieces in a most cruel and barbarous manner by racks, or publicly executed.

In 359, *Sapor* king of Persia began hostilities, being encouraged thereto by the absence of *Urficinus*, whom the emperor had recalled, and appointed in his room one *Sabinianus*, a person very unfit for such an office. During this campaign, however, he made very little progress; having only taken two Roman forts, and destroyed the city of *Amida*, the siege of which is said to have cost him 30,000 men. On the first news of the Persian invasion, *Constantius* had thought proper to send *Urficinus* into the East; but his enemies prevented him from receiving the supplies necessary for carrying on the war, so that he found it impossible to take any effectual means for stopping the progress of the Persians. On his return, he was unexpectedly charged with the loss of *Amida*, and all the disasters that had happened during the campaign. Two judges were appointed to inquire into his conduct; but they, being creatures of his enemies, left the matter doubtful. On this *Urficinus* was so much exasperated, that he appealed to the emperor, and in the heat of passion, let fall some unguarded expressions, which being immediately carried to the emperor, the general was deprived of all his employments.

Constantius resolved to march next year in person against the Persians; but in the mean time, dreading to encounter so formidable an enemy, he applied himself wholly to the assembling of a mighty army, by which he might be able fully to cope with them. For this purpose he wrote to *Julian* to send him part of his forces, without considering that by so doing he left the province of *Gaul* exposed to the ravages of the barbarians. *Julian* resolved immediately to comply with the emperor's orders; but at the same time to abate the dignity of *Cæsar*, that he might not be blamed for the loss of the province. Accordingly he suffered the best soldiers to be draughted out of his army. They were, however, very unwilling to leave him, and at last proclaimed him emperor. Whether this was done absolutely against *Julian's* consent or not is uncertain; but he wrote to the emperor, and persuaded the whole army also to send a letter along with his, in which they acquainted *Constantius* with what had happened, and entreated him to acknowledge *Julian* as

his partner in the empire. But this was positively refused by Constantius, who began to prepare for war. Julian then, desiring to be before-hand with the emperor, caused his troops take an oath of allegiance to himself, and with surprising expedition made himself master of the whole country of Illyricum, and the important pass separating that country from Thrace. Constantius was thunder-struck with this news; but hearing that the Persians had retired, he marched with all his forces against his competitor. On his arrival at Tarsus in Cilicia, he was seized with a feverish distemper, occasioned chiefly by the uneasiness and perplexity of his mind. He pursued his march, however, to *Mopsucenus*, a place on the borders of Cilicia, at the foot of Mount Taurus. Here he was obliged to stop by the violence of his disorder, which increased every day, and at last carried him off on the 13th of November 361, in the 45th year of his age.

56
Julian re-
stores the
heathen re-
ligion.

By the death of Constantius, Julian now became master of the whole Roman empire without a rival. But he had been educated in the Christian religion; but secretly apostatized from it long before, and as soon as he saw himself master of Illyricum, openly avowed his apostasy, and caused the temples of the gods to be opened. When the messengers arrived at Naissus in Illyricum, where he then was, to acquaint him with his being sole master of the empire, they found him consulting the entrails of victims concerning the event of his journey. As the omens were uncertain, he was at that time very much embarrassed and perplexed; but the arrival of the messengers put an end to all his fears, and he immediately set out for Constantinople. At Heraclea he was met by almost all the inhabitants of this metropolis, into which he made his public entry on the 11th of December 361, being attended by the whole senate in a body, by all the magistrates, and by the nobility magnificently dressed, every one testifying the utmost joy at seeing such a promising young prince raised to the empire without bloodshed. He was again declared emperor by the senate of Constantinople; and as soon as that ceremony was over, he caused the obsequies of Constantius to be performed with great pomp.

57
Condemns
some of the
late emper-
or's mini-
sters.

The first care of Julian was to inquire into the conduct of the late emperor's ministers. Several of these, having been found guilty of enormous crimes, were condemned and executed; particularly the noted informer *Paulus Catena*, and another named *Apodamus*, were sentenced to be burnt alive. Along with these, however, was put to death one *Ursula*, a man of unexceptionable character, and to whom Julian himself was highly indebted. He had been supplied with money by Ursula unknown to the emperor, at the time when he was sent into Gaul with the title of Cæsar, but without the money necessary for the support of that dignity. For what reason he was now put to death, historians do not acquaint us. Julian himself tells us that he was executed without his knowledge.

58
Reforms
the court.

The emperor next set about reforming the court. As the vast number of offices was in his time become an intolerable burden, he discharged all those whom he thought useless. He reduced, among the rest, the officers called *agentes in rebus*, from 10,000 to 17; and discharged thousands of cooks, barbers, &c. who

by their large salaries drained the exchequer. The *curiosi*, whose office it was to inform the emperor of what had passed in the different provinces, were all discharged, and that employment entirely suppressed. Thus he was enabled to ease the people of the heavy taxes with which they were loaded: and this he did by abating a fifth part of all taxes and imposts throughout the kingdom.

As to religious matters, Julian, as before observed, was a Pagan, and immediately on his accession to the throne, restored the heathen religion. He invited to court, the philosophers, magicians, &c. from all parts; nevertheless he did not raise any persecution against the Christians. On the contrary, he recalled from banishment all the orthodox bishops who had been sent into exile during the former reign; but with a design, as is observed both by the Christian and Pagan writers, to raise disturbances and sow dissensions in the church.

As the Persians were now preparing to carry on the war with vigour, Julian found himself under a necessity of marching against them in person. But before he set out, he enriched the city of Constantinople with many valuable gifts. He formed a large harbour to shelter the ships from the south wind, built a magnificent porch leading to it, and in another porch a stately library, in which he lodged all his books. In the month of May, A.D. 362, he set out for Antioch, and on the first of January renewed in that city the sacrifices to Jupiter for the safety of the empire, which had been so long omitted. During his stay in this city, he continued his preparations for the Persian war, erecting magazines, making new levies, and above all consulting the oracles, aruspices, magicians, &c. The oracles of Delphi, Delos, and Dodona, assured him of victory. The aruspices, indeed, and most of his courtiers and officers, did all that lay in their power to divert him from his intended expedition; but the deceitful answers of the oracles and magicians, and the desire of adding the Persian monarch to the many kings he had already seen humbled at his feet, prevailed over all other considerations. Many nations sent deputies to him offering their assistance, but these offers he rejected, telling them that the Romans were to assist their allies, but stood in no need of any assistance from them. He likewise rejected, and in a very disobliging manner, the offers of the Saracens; answering them, when they complained of his stopping the pension paid them by other emperors, that a warlike prince had steel, but no gold; which they resenting, joined the Persians, and continued faithful to them to the last. However, he wrote to Arfaces king of Armenia, enjoining him to keep his troops in readiness to execute the orders he should soon transmit to him.

Having made the necessary preparations for so important an enterprise, Julian sent orders to his troops to cross the Euphrates, designing to enter the enemy's country before they had the least notice of his march; for which purpose he had placed guards on all the roads. From Antioch he proceeded to Litarba, a place about 15 leagues distant, which he reached the same day. From thence he went to Beraa, where he halted a day, and exhorted the council to restore the worship of the gods; but this exhortation, it seems, was com-

plied with but by few. From *Beræa* he proceeded to *Batnæ*; and was better pleased with the inhabitants of the latter, because they had, before his arrival, restored the worship of the gods. There he offered sacrifices; and having immolated a great number of victims, he pursued the next day his journey to *Hierapolis*, the capital of the province of *Euphratesiana*, which he reached on the 9th of March. Here he lodged in the house of one for whom he had a particular esteem, chiefly because neither *Constantius* nor *Gallus*, who had both lodged in his house, had been able to make him renounce the worship of his idols. As he entered this city 50 of his soldiers were killed by the fall of a porch. He left *Hierapolis* on the 13th of March; and having passed the *Euphrates* on a bridge of boats, came to *Batnæ* a small city of *Osroene*, about 10 leagues from *Hierapolis*; and here 50 more of his soldiers were killed by the fall of a stack of straw. From *Batnæ* he proceeded to *Carrhæ*; where, in the famous temple of the moon, it is said he sacrificed a woman to that planet.

66
Invades
Persia.

While *Julian* continued in this city, he received advice that a party of the enemies horse had broke into the Roman territories. On this he resolved to leave an army in *Mesopotamia*, to guard the frontiers of the empire on that side, while he advanced on the other into the heart of the Persian dominions. This army consisted, according to some, of 20,000, according to others, of 30,000 chosen troops. It was commanded by *Procopius*, and *Sebastian* a famous manichean who had been governor of *Egypt*, and had persecuted there, with the utmost cruelty, the orthodox Christians. These two were to join, if possible, *Arfaces* king of *Armenia*, to lay waste the fruitful plains of *Media*, and meet the emperor in *Assyria*. To *Arfaces* *Julian* himself wrote, but in the most dissembling manner imaginable, threatening to treat him as a rebel if he did not execute, with the utmost punctuality, the orders given him; and at the conclusion told him, that the God he adored would not be able to screen him from his indignation.

There were two roads leading from *Carrhæ* to *Persia*: the one to the left by *Nisibis*; the other to the right through the province of *Assyria*, along the banks of the *Euphrates*. *Julian* chose the latter, but caused magazines to be erected on both roads; and after having viewed his army, set out on the 25th of March. He passed the *Abora*, which separated the Roman and Persian dominions, near its conflux with the *Euphrates*; after which he broke down the bridge, that his troops might not be tempted to desert, seeing they could not return home. As he proceeded on his march, a soldier and two horses were struck dead by a flash of lightning; and a lion of an extraordinary size presenting himself to the army, was in a moment dispatched by the soldiers with a shower of darts. These omens occasioned great disputes between the philosophers and aurificers: the latter looking upon them as inauspicious, advised the emperor to return; but the former refuted their arguments with others more agreeable to *Julian's* temper.

67
Lays waste
Assyria.

Having passed the *Abora*, *Julian* entered *Assyria*, which he found very populous, and abounding with all the necessaries of life; but he laid it waste far and

near, destroying the magazines and provisions which he could not carry along with him; and thus he put it out of his power to return the same way he came, a step which was judged very impolitic. As he met with no army in the field to oppose him, he advanced to the walls of *Ctesiphon*, the metropolis of the Persian empire; having reduced all the strong holds that lay in his way. Here, having caused the canal to be cleared, which was formerly dug by *Trajan* between these two rivers, he conveyed his fleet from the former to the latter. On the banks of the *Tigris* he was opposed by the enemy. But *Julian* passed that river in spite of their utmost efforts, and drove them into the city with the loss of a great number of their men, he himself, in the mean time, losing only 70 or 75.

Julian had now advanced so far into the enemy's country, that he found it necessary to think of a retreat, as it was impossible for him to winter in *Persia*. For this reason he made no attempt on *Ctesiphon*, but began to march back along the banks of the *Tigris*, soon after he had passed that river. In the mean time the king of *Persia* was assembling a formidable army, with a design to fall upon the Romans in their march; but being desirous of putting an end to so destructive a war, he sent very advantageous proposals of peace to *Julian*. These the Roman emperor very imprudently rejected; and soon after, deceived by treacherous guides, he quitted the river, and entered into an unknown country totally laid waste by the enemy, and where he was continually harried by strong parties, who in a manner surrounded his army, and attacked him sometimes in the front, and sometimes in the rear. A still worse step he was persuaded to take by the treacherous guides already mentioned; and this was to burn his fleet, lest it should fall into the hands of the enemy. As soon as the fleet was set on fire, the whole army cried out, that the emperor was betrayed, and that the guides were traitors employed by the enemy. *Julian* ordered them immediately to be put to the rack, upon which they confessed the treason; but it was too late. The fleet was already in flames; they could by no means be extinguished; and no part was saved except 12 vessels, which were designed to be made use of in the building of bridges, and for this purpose were conveyed over land in waggons.

The emperor thus finding himself in a strange country, and his army greatly dispirited, called a council of his chief officers, in which it was resolved to proceed to *Corduene*, which lay south of *Armenia*, and belonged to the Romans. With this view, they had not proceeded far when they were met by the king of *Persia*, at the head of a very numerous army, attended by his two sons, and all the principal nobility of the kingdom. Several sharp encounters happened, in which though the Persians were always defeated, yet the Romans reaped no advantages from their victories, but were reduced to the last extremity for want of provisions. In one of these skirmishes, when the Romans were suddenly attacked, the emperor, eager to repulse the enemy, hastened to the field of battle without his armour, when he received a mortal wound by a dart, which, through his arm and side, pierced his very liver. Of this wound he died the same night,

71
Jovian
restored to the empire.

the 26th of June 363, in the 32^d year of his age, after having reigned scarce 20 months from the time he became sole master of the Roman empire.

As Julia had declined naming any successor, the choice of a new emperor devolved on the army. They unanimously chose Jovian, a very able commander, whose father had lately resigned the post of *comes domesticorum*, in order to lead a retired life. The valour and experience of Jovian, however, were not sufficient to extricate the Roman army from the difficulties in which they had been plunged by the imprudence of his predecessor. The famine raged in the camp to such a degree, that not a single man would have been left alive, had not the Persians unexpectedly sent proposals of peace. These were now received with the utmost joy. A peace was concluded for 30 years; the terms of which were, that Jovian should restore to the Persians the five provinces which had been taken from them in the reign of Dioclesian, with several castles, and the cities of Nisibis and Singara. After the conclusion of the treaty, Jovian pursued his march without molestation. When he arrived at Antioch, he revoked all the laws that had been made in the former reign against Christianity and in favour of paganism. He espoused also the cause of the orthodox Christians against the Arians; and recalled all those who had been formerly banished, particularly Athanasius, to whom he wrote a very obliging letter with his own hand. It is generally believed also that Athanasius, at the desire of Jovian, now composed the creed which still goes by his name, and is subscribed by all the bishops in Europe. But this emperor did not live to make any great alterations, or even to visit his capital as emperor; for in his way to Constantinople he was found dead in his bed, on the 16th or 17th of February 364, after he had lived 33 years, and reigned seven months and 40 days.

73
His death.74
Valentinian
chosen emperor,
chooses Valens for his partner.

After the death of Jovian, Valentinian was chosen emperor. Immediately on his accession the soldiers mutinied, and with great clamour required him to choose a partner in the sovereignty. Though he did not instantly comply with their demand, yet in a few days he chose his brother Valens for his partner; and, as the empire was threatened on all sides with an invasion of the barbarous nations, he thought proper to divide it. This famous partition was made at Mediana in Dacia; when Valens had for his share the whole of Asia, Egypt, and Thrace; and Valentinian all the West; that is, Illyricum, Italy, Gaul, Spain, Britain, and Africa.

75
Procopius
revolts.

After this partition, Valens returned to Constantinople, where the beginning of his reign was disturbed by the revolt of Procopius, a relation of Julian. On the death of that emperor, he had fled into Taurica Cherfoneus for fear of Jovian; but not trusting the barbarians who inhabited that country, he returned in disguise into the Roman territories, where having gained over an eunuch of great wealth, by name *Eugenius*, lately disgraced by Valens, and some officers who commanded the troops sent against the Goths, he got himself proclaimed emperor. At first he was joined only by the lowest of the people, but at length he was acknowledged by the whole city of Constantinople. On the news of this revolt, Valens would

have abdicated the sovereignty, had he not been prevented by the importunities of his friends. He therefore dispatched some troops against the usurper; but these were gained over, and Procopius continued for some time to gain ground. It is probable he would finally have succeeded, had he not become so much elated with his good fortune, that he grew tyrannical and insupportable to his own party. In consequence of this alteration in his disposition, he was first abandoned by some of his principal officers; and soon after defeated in battle, taken prisoner, and put to death.

Constantinopolitan history.

76
Is defeated and put to death.77
War with the Goths.

This revolt produced a war betwixt Valens and the Goths. The latter, having been solicited by Procopius, had sent 3000 men to his assistance. On hearing the news of the usurper's death, they marched back; but Valens detached against them a body of troops, who took them all prisoners notwithstanding the vigorous resistance they made. Athanasius, king of the Goths, expostulated on this proceeding with Valens; but that emperor proving obstinate, both parties prepared for war. In 367 and 369, Valens gained great advantages over his enemies; and obliged them to sue for peace, which was concluded upon terms very advantageous to the Romans. The rest of this reign contains nothing remarkable, except the cruelty with which Valens persecuted the orthodox clergy. The latter felt 80 of their number to him, in order to lay their complaints before him; but he, instead of giving them any relief, determined to put them all to death. But the person who was ordered to execute this sentence, fearing lest the public execution of so many ecclesiastics might raise disturbances, ordered them all to be put on board a ship, pretending that the emperor had ordered them only to be sent into banishment; but when the vessel was at some distance from land, the mariners set fire to it, and made their own escape in the boat. The ship was driven by a strong wind into an harbour, where it was consumed and all that were in it. A persecution was also commenced against magicians, or those who had books of magic in their custody. This occasioned the destruction of many innocent persons; for books of this kind were often conveyed into libraries unknown to the owners of them, and this was certainly followed by death and confiscation of goods. Hereupon persons of all ranks were seized with such terror that they burnt their libraries, lest books of magic should have been secretly conveyed in amongst the others.

78
Eighty orthodox clergy ecclesiastics put to death.79
Magicians persecuted.

In 378, the Goths whom Valens had admitted into Thrace, advanced from that province to Macedon and Thessaly, where they committed dreadful ravages. They afterwards blocked up the city of Constantinople, plundered the suburbs, and at last totally defeated and killed the emperor himself. The day after the battle, hearing that an immense treasure was lodged in Adrianople, the barbarians laid siege to that place: but being quite strangers to the art of besieging towns, they were repulsed with great slaughter; upon which they dropped that enterprize, and returned before Constantinople. But here great numbers of them were cut in pieces by the Saracens, whom *Maria* their queen had sent to the assistance of the Romans; so that they were obliged to abandon this de-

80

Constantinople likewise, and retire from the neighbourhood of that city.

81
Gratian takes Theodosius for his partner.

By the death of Valens, the empire once more fell into the hands of a single person. This was *Gratian*, who had held the empire of the West after the death of Valentinian. He repulsed many barbarous nations who threatened the empire at that time with dissolution; but finding himself pressed on all sides, he soon resolved to take a colleague, in order to ease him of some part of the burden. Accordingly, on the 19th of January 379, he declared Theodosius his partner in the empire, and committed to his care all the provinces which had been governed by Valens.

82
Miserable state of the empire on his accession.

Theodosius is greatly extolled by the historians of those ages on account of his extraordinary valour and piety; and for these qualifications has been honoured with the surname of the *Great*. From the many persecuting laws, however, made in his time, it would seem that his piety was at least very much misguided; and that if he was naturally of a humane and compassionate disposition, superstition and passion had often totally obscured it. He certainly was a man of great conduct and experience in war, and indeed the present state of the empire called for an exertion of all his abilities. The provinces of Dacia, Thrace, and Illyricum, were already lost; the Goths, Taifali, Alans, and Huns, were masters of the greatest part of these provinces, and had ravaged and laid waste the rest. The Iberians, Armenians, and Persians, were likewise up in arms, and ready to take advantage of the distracted state of the empire. The few soldiers, who had survived the late defeat, kept within the strong holds of Thrace, without daring so much as to look abroad, much less face the victorious enemy, who moved about the country in great bodies. But notwithstanding this critical situation, the historians of those times give us no account of the transactions of the year 379. Many great battles indeed are said to have been fought, and as many victories obtained by Theodosius; but the accounts of these are so confused and contradictory, that no stress can be laid upon them.

83
The Goths defeated by Theodosius.

In the month of February 380, Theodosius was seized with a dangerous malady, so that Gratian found himself obliged to carry on the war alone. This emperor, apprehending that the neighbouring barbarians might break into some of the provinces, concluded a peace with the Goths, which was confirmed by Theodosius on his recovery. The treaty was very advantageous to the barbarians; but they, disregarding all their engagements, no sooner heard that Gratian had left Illyricum, than they passed the Danube, and breaking into Thrace and Pannonia, advanced as far as Macedon, destroying all with fire and sword. Theodosius, however, drawing together his forces, marched against them; and, according to the most respectable authorities, gained a complete victory; though Zosimus relates, that he was utterly defeated.

The following year, Athanaric, the most powerful of all the Gothic princes, being driven out by a faction at home, resorted to Theodosius, by whom he was received with great tokens of friendship. The emperor himself went out to meet him, and attended him with his numerous retinue into the city. The

Gothic prince died the same year; and Theodosius caused him to be buried after the Roman manner with such pomp and solemnity, that the Goths, who attended him in his flight, returned home with a resolution never to molest the Romans any more. Nay, out of gratitude to the emperor, they took upon them to guard the banks of the Danube, and prevent the empire from being invaded on that side.

In 383, one Maximus revolted against Gratian in Britain; and in the end, having got the unhappy emperor into his power, caused him to be put to death, and assumed the empire of the West himself. Gratian had divided his dominions with his brother Valentinian, whom he allowed to reign in Italy and West Illyricum, reserving the rest to himself. Maximus therefore, immediately after his usurpation, sent deputies to Theodosius, assuring him that he had no designs on the dominions of Valentinian. As Theodosius at that time found himself in danger from the barbarians, he not only forbore to attack Maximus after this declaration, but even acknowledged him for his partner in the empire. It was not long, however, before the ambition of the usurper prompted him to break his promise. In 387, he passed the Alps on a sudden, and meeting with no opposition marched to Milan where Valentinian usually resided. The young prince fled first to Aquileia; and from thence to Thessalonica, to implore the protection of Theodosius. The latter, in answer to Valentinian's letter, informed him, that he was not at all surprised at the progress Maximus had made, because the usurper had protected, and Valentinian had persecuted, the orthodox Christians. At last he prevailed on the young prince to renounce the Arian heresy which he had hitherto maintained; after which Theodosius promised to assist him with all the forces of the East. At first, however, he sent messengers to Maximus, earnestly exhorting him to restore the provinces he had taken from Valentinian, and content himself with Gaul, Spain, and Britain. But the usurper would hearken to no terms. This very year he besieged and took Aquileia, Quaderna, Bononia, Mutina, Rhegium, Placentia, and many other cities in Italy. The following year he was acknowledged in Rome, and in all the provinces of Africa. Theodosius therefore, finding a war inevitable, spent the remaining months of this and the beginning of the following year in making the necessary preparations. His army consisted chiefly of Goths, Huns, Alans, and other barbarians, whom he was glad to take into the service in order to prevent their raising disturbances on the frontiers. He defeated Maximus in two battles, took him prisoner, and put him to death. The usurper had left his son Victor, whom he created Augustus, in Gaul, to awe the inhabitants in his absence. Against him the emperor dispatched Arbogastes, who took him prisoner after having dispersed the troops that attended him, and put him to death. The victory was used afterwards by Theodosius with great clemency and moderation.

In 389, Theodosius took a journey to Rome; and, according to Prudentius, at this time converted the senate and people from idolatry to Christianity. The next year was remarkable for the destruction of the celebrated temple of Serapis in Alexandria; which, according

according to the description of Ammianus Marcellinus, surpassed all others in the world, that of Jupiter Capitolinus alone excepted. The reason of its being now destroyed was as follows. Theophilus, bishop of Alexandria, having begged and obtained of the emperor an old temple, formerly consecrated to Bacchus, but then ruined and forsaken, with a design to convert it into a church, the workmen found among the rubbish several obscene figures, which the bishop, to ridicule the superstition of the heathens, caused to be exposed to public view. This provoked the Pagans to such a degree that they flew to arms; and falling unexpectedly upon the Christians, cut great numbers of them in pieces. The latter, however, soon took arms in their own defence; and being supported by the few soldiers who were quartered in the city, began to repel force by force. Thus a civil war was kindled, and no day passed without some encounter. The Pagans used to retire to the temple of Serapis; and thence falling out unexpectedly seized on such Christians as they met, and, dragging them into the temple, either forced them by the most exquisite torments to sacrifice to their idol, or, if they refused, racked them to death. As they soon expected to be attacked by the emperor's troops, they chose a philosopher, named *Olympus*, for their leader, with a design to defend themselves to the last extremity. The emperor, however, would not suffer any punishment to be inflicted upon them for the lives of those they had taken away, but readily forgave them; however, he ordered all the temples of Alexandria to be immediately pulled down, and commanded the bishop to see his orders put in execution. The Pagans no sooner heard that the emperor was acquainted with their proceedings than they abandoned the temple, which was in a short time destroyed by Theophilus; nothing being left except the foundations, which could not be removed on account of the extraordinary weight and size of the stones. Not satisfied with the destruction of the Alexandrian temples, the zealous bishop encouraged the people to pull down all the other temples, oratories, chapels, and places set apart for the worship of the heathen gods throughout Egypt, and the statues of the gods themselves to be either burnt or melted down. Of the innumerable statues which at that time were to be found in Egypt, he is said to have spared but one, viz. that of an ape, in order to expose the Pagan religion to ridicule. On his return to Constantinople, Theodosius ordered such temples as were yet standing to be thrown down, and the Arians to be every where driven out of the cities.

In 392, Valentinian, emperor of the West, was treacherously murdered by Arbogastes his general; who, though he might afterwards have easily seized on the sovereignty himself, chose to confer it upon one Eugenius, and to reign in his name. This new usurper, though a Christian, was greatly favoured by the Pagans, who were well apprised that he only bore the title of emperor, while the whole power lodged in Arbogastes, who pretended to be greatly attached to their religion. The auspices began to appear a-new, and informed him that he was destined to the empire of the whole world; that he would soon gain a complete victory over Theodosius, who was as much

hated as Eugenius was beloved by the gods, &c. But though Eugenius seemed to favour the Pagans, yet in the very beginning of his reign he wrote to St Ambrose. The holy man did not answer his letter till he was pressed by some friends to recommend them to the new prince; and then he wrote to this infamous usurper with all the respect due to an emperor. Soon after his accession to the empire, Eugenius sent deputies to Theodosius; and they are said to have been received by him in a very obliging manner. He did not, however, intend to enter into any alliance with this usurper, but immediately began his military preparations. In 394, he set out from Constantinople, and was at Adrianople on the 15th of June that year. He bent his march through Dacia, and the other provinces between Thrace and the Julian Alps, with a design to force the passes of these mountains, and break into Italy before the army of Eugenius was in a condition to oppose him. On his arrival at the Alps, he found these passes guarded by Flavianus prefect of Italy, at the head of a considerable body of Roman troops. These were utterly defeated by Theodosius, who thereupon crossed the Alps and advanced into Italy. He was soon met by Eugenius; and a bloody battle ensued, without any decisive advantage on either side. The next day the emperor led his troops in person against the enemy, utterly defeated them, and took their camp. Eugenius was taken prisoner by his own men and brought to Theodosius, who reproached him with the murder of Valentinian, with the calamities he had brought on the empire by his unjust usurpation, and with putting his confidence in Hercules, and not in the true God; for on his chief standard he had displayed the image of that fabulous hero. Eugenius begged earnestly for his life; but while he lay prostrate at the emperor's feet, his own soldiers cut off his head, and carrying it about on the point of a spear, shewed it to those in the camp, who had not yet submitted to Theodosius. At this they were all thunderstruck; but being informed that Theodosius was ready to receive them into favour, they threw down their arms and submitted. After this Arbogastes despairing of pardon fled to the mountains; but being informed that diligent search was made for him, he laid violent hands on himself. His children, and those of Eugenius, took sanctuary in churches: but the emperor not only pardoned, but took the opportunity of converting them to Christianity, restored to them their paternal estates, and raised them to considerable employments in the state. Soon after this Theodosius appointed his son Honorius emperor of the West, assigning him for his share, Italy, Gaul, Spain, Africa, and west Illyricum. The next year, as he prepared for his return to Constantinople, he was seized with a dropsy, owing to the great fatigues he had undergone during the war. As soon as he perceived himself to be in danger, he made his will, by which he bequeathed the empire of the East to Arcadius, and confirmed Honorius in the possession of the West. He likewise confirmed the pardon which he had granted to all those who had borne arms against him, and remitted a tribute which had proved very burdensome to the people; and charged his two sons to see these points of his will executed. He died at Milan on the 17th of January 395, in the 16th of his reign, and 50th of his age.

96
Great fire
at Constanti-
nople.

From the time of Theodosius to the time when the Roman empire in the West was totally destroyed by the Goths, we find but very little remarkable in the history of Constantinople. At this time the eastern empire was usurped by Basiliscus, who had driven out Zeno the lawful emperor; being assisted in his conspiracy by the empress Verina his sister. Zeno fled into Isauria, whither he was pursued by *Illus* and *Trecondes*, two of the usurper's generals; who having easily defeated the few troops he had with him, forced the unhappy prince to shut himself up in a castle, which they immediately invested. But in a short time Basiliscus having dissembled the people by his cruelty, avarice, and other bad qualities, for which he was no less remarkable than his predecessor had been, his generals joined with Zeno whom they restored to the throne. After his restoration, Zeno having got Basiliscus into his power, confined him in a castle of Cappadocia together with his wife Zenonides, where they both perished with hunger and cold. This happened in the year 477, after Basiliscus had reigned about 20 months. During the time of this usurpation a dreadful fire happened at Constantinople, which consumed great part of the city, with the library containing 120,000 volumes; among which were the works of Homer, written as is said on the great gut of a dragon 120 feet long.

The misfortunes which Zeno had undergone did not work any reformation upon him. He still continued the same vicious courses which had given occasion to the usurpation of Basiliscus. Other conspiracies were formed against him, but he had the good fortune to escape them. He engaged in a war with the Ostrogoths, in which he proved unsuccessful, and was obliged to yield the provinces of Lower Dacia and Mœsia to them. In a short time, however, Theodoric their king made an irruption into Thrace, and advanced within 15 miles of Constantinople, with a design to besiege that capital: but the following year 485, they retired in order to attack Odoacer king of Italy; of which country Theodoric was proclaimed king in 493. The emperor Zeno died in the year 491, in the 65th year of his age, and 17th of his reign.

The Roman empire had now for a long time been on the decline: the ancient valour and military discipline which had for such a long time rendered the Romans superior to other nations, had greatly degenerated; so that they were now by no means so powerful as formerly. The tumults and disorders which had happened in the empire from time to time by the many usurpations, had contributed also to weaken it very much. But what proved of the greatest detriment was the allowing vast swarms of barbarians to settle in the different provinces, and to serve in the Roman empire in separate and independent bodies. This had proved the immediate cause of the dissolution of the western empire; but as it affected the eastern parts less, the Constantinopolitan empire continued for upwards of 900 years after the western one was totally dissolved. The weak and imprudent administration of Zeno and Anastasius who succeeded him, had reduced the eastern empire still more; and it might possibly have expired in a short time after the western one, had not the wife and vigorous conduct of Justin, and

tinian.

his partner Justinian, revived in some measure the ancient martial spirit which had originally raised the Roman empire to its highest pitch of grandeur.

Justin ascended the throne in 518. In 521 he engaged in a war with the Persians, who had all along been very formidable enemies to the Roman name. Against them he employed the famous Belisarius; but of him we hear nothing remarkable till after the accession of Justinian. This prince was the nephew of Justin, and was by him taken as his partner in the empire in 527; and the same year Justin died, in the 77th year of his age and 9th of his reign. Justinian being now sole master of the empire, bent his whole force against the Persians. The latter proved successful in the first engagement; but were soon after utterly defeated by Belisarius on the frontiers of Persia, and likewise by another general named *Dorotheus* in Armenia. The war continued with various success during the first five years of Justinian's reign. In the sixth year a peace was concluded upon the following terms: 1. That the Roman emperor should pay to Cosroes the king of Persia, 1000 pounds weight of gold. 2. That both princes should restore the places they had taken during the wars. 3. That the commander of the Roman forces should no longer reside at Daras on the Persian frontiers, but at a place called *Constantina* in Mesopotamia, as he had formerly done. 4. That the Iberians, who had sided with the Romans, should be at liberty to return to their own country, or stay at Constantinople. This peace, concluded in 532, was styled *eternal*; but in the event proved of very short duration.

About this time happened at Constantinople the greatest tumult mentioned in history. It began among the different factions in the circus, but ended in an open rebellion. The multitude, highly dissatisfied with the conduct of John the *presidus prætoris*, and of Trebonianus then questor, forced *Hypatius*, nephew to the emperor Anastasius, to accept the empire, and proclaimed him with great solemnity in the forum. As the two above mentioned ministers were greatly abhorred by the populace on account of their avarice, Justinian immediately discharged them, hoping by that means to appease the tumult: but this was so far from answering the purpose, that the multitude only grew the more outrageous upon it; and most of the senators joining them, the emperor was so much alarmed, that he had thoughts of abandoning the city and making his escape by sea. In this dilemma the empress Theodora encouraged and persuaded him rather to part with his life than the kingdom; and he at last resolved to defend himself to the utmost, with the few senators who had not yet abandoned him. In the mean time the rebels having attempted in vain to force the gates of the palace, carried Hypatius in triumph to the circus; where, while he was beholding the sports from the imperial throne, amidst the shouts and acclamations of the people, Belisarius, who had been recalled from Persia, entered the city with a considerable body of troops. Being then applied of the usurpation of Hypatius, he marched straight to the circus; fell sword in hand upon the disarmed multitude; and with the assistance of a band of Heruli, headed by Mundus governor of Illyricum, cut about

30,000 of them in pieces. Hypatius the usurper, and Pompeius another of the nephews of Anastasius, were taken prisoners and carried to the emperor, by whose orders they were both beheaded, and their bodies cast into the sea. Their estates were confiscated, and likewise the estates of such senators as had joined with them; but the emperor caused great part of their lands and effects to be afterwards restored, together with their honours and dignities, to their children.

Justinian having now no other enemy to contend with, turned his arms against the Vandals in Africa, and the Goths in Italy; both which provinces he recovered out of the hands of the barbarians*. But before his general Belisarius had time to establish fully the Roman power in Italy, he was recalled in order to carry on the war against Cosroes king of Persia, who, in defiance of the treaty formerly concluded in 540, entered the Roman dominions at the head of a powerful army. The same year, however, a peace was concluded between the two nations upon the following conditions: 1. That the Romans should, within two months, pay to the Persian king 5000 pounds weight of gold, and an annual pension of 500. 2. That the Persians should relinquish all claim to the fortresses of Daras, and maintain a body of troops to guard the Caspian gates, and prevent the barbarians from breaking into the empire. 3. That upon payment of the above mentioned sum, Cosroes should immediately withdraw his troops from the Roman dominions. The treaty being signed, and the stipulated sum paid, Cosroes began to march back again; but by the way plundered several cities as if the war had still continued. Hereupon Justinian resolved to pursue the war with the utmost vigour; and for that purpose dispatched Belisarius into the East. But soon after, he was obliged to recall him in order to oppose the Goths who had gained great advantages in Italy after his departure. The Persian war was then carried on with indifferent success till the year 558, when a peace was concluded upon the emperor again paying an immense sum to the enemy. The same year the Huns, passing the Danube in the depth of winter, marched in two bodies directly for Constantinople; and laying waste the countries through which they passed, came, without meeting the least opposition, within 150 furlongs of the city. But Belisarius marching out against them with an handful of men, put them to flight; the emperor, however, to prevent them from invading the empire anew, agreed to pay them an annual tribute, upon their promising to defend the empire against all other barbarians, and to serve in the Roman armies when required. This was the last exploit performed by Belisarius, who on his return to Constantinople was disgraced, stripped of all his employments, and confined to his house, on pretence of a conspiracy against the emperor*. In the year 565 a real conspiracy was formed against Justinian, which he happily escaped, and the conspirators were executed; but the emperor did not long survive it, being carried off by a natural death in 566, in the 39th year of his reign.

During the reign of Justinian, the majesty of the Roman empire seemed to revive. He recovered the provinces of Italy and Africa out of the hands of the barbarians, by whom they had been held for a num-

ber of years; but after his death they were soon lost, and the empire tended fast to dissolution. In 569 Italy was conquered by the Lombards, who held it for the space of 200 years. Some amends, however, was made for this loss by the acquisition of *Perfarmania*; the inhabitants of which, being persecuted by the Persians on account of the Christian religion which they professed, revolted to the Romans. This produced a war between the two nations, who continued to weaken each other, till at last the Persian monarchy was utterly overthrown, and that of the Romans greatly reduced by the Saracens†. These new enemies attacked the Romans in the year 632, and pursued their conquests with incredible rapidity. In the space of four years they reduced the provinces of Egypt, Syria, and Palestine. In 648 they were also masters of Mesopotamia, Phenicia, Africa, Cyprus, Aradus, and Rhodes; and having defeated the Roman fleet, commanded by the emperor Constantine in person, they concluded a peace on condition of keeping the vast extent of territory they had seized, and paying for it 1000 nummi a-year.

An expedition against the Lombards was about this time undertaken, but with very little success, a body of 20,000 Romans being almost entirely cut off by one of the Lombard generals. In 671 the Saracens ravaged several provinces, made a descent in Sicily, took and plundered the city of Syracuse, and over-ran the whole island, destroying every thing with fire and sword. In like manner they laid waste Cilicia; and having passed the winter at Smyrna, they entered Thrace in the winter of the year 672, and laid siege to Constantinople itself. Here, however, they were repulsed with great loss; but next spring they renewed their attempt, in which they met with the same bad success; many of their ships being burnt by the *sea-fire*, as it was called, because it burnt under water; and in their return home their fleet was wrecked off the Scyllæan promontory. At last a peace was concluded for 30 years, on condition that the Saracens should retain all the provinces they had seized; and that they should pay to the emperor and his successors 3000 pounds weight of gold, 50 slaves, and as many choice horses.

This peace was scarce concluded, when the empire was invaded by a new enemy, who proved very troublesome for a long time. These were the Bulgarians; who breaking into Thrace, defeated the Roman army sent against them, and ravaged the country far and wide. The emperor consented to pay them an annual pension, rather than continue a doubtful war; and allowed them to settle in Lower Mæsia, which from them was afterwards called *Bulgaria*. In 687, they were attacked by Justinian II. who entered their country without provocation, or regarding the treaties formerly concluded with them. But they falling suddenly upon him, drove him out of their country, and obliged him to restore the towns and captives he had taken. In 697, this emperor was deposed; and in his exile fled to Trebelis king of the Bulgarians, by whom he was kindly entertained, and by whose means he was restored to his throne; but soon forgetting this favour, he invaded the country of the Bulgarians, with a design to wrest from them those provinces

provinces which he had yielded to them. He was at-
tended in this expedition by no better success than his
ingratitude deserved, his army being utterly defeated,
and he himself obliged to make his escape in a light
vessel to Constantinople. The Bulgarians continued
their inroads and ravages at different times, generally
defeating the Romans who ventured to oppose them,
till the year 800, the seventh of the reign of Nicepho-
rus, when they surprised the city of Sardica in Mœsia,
and put the whole garrison consisting of 6000 men to
the sword. The emperor marched against them with
a considerable army: but the enemy retired at his ap-
proach; and he, instead of pursuing them, returned to
Constantinople. Two years after, he entered Bulgar-
ia at the head of a powerful army, destroying every
thing with fire and sword. The king offered to con-
clude a peace with him upon honourable terms; but
Nicephorus, rejecting his proposals, continued to waste
the country, destroying the cities, and putting all the
inhabitants, without distinction of sex or age, to the
sword. The king was so much affected with these
cruelties which were exercised on his subjects, that he
sent a second embassy to Nicephorus, offering to con-
clude a peace with him upon any terms, provided he
would quit his country. But Nicephorus dismissing the
ambassadors with scorn, the Bulgarian monarch attacked
unexpectedly the Roman camp, forced it, and cut off al-
most the whole army, with the emperor himself, and a
great number of patricians. His successor Michael like-
wise engaged in a war with the Bulgarians; but being
utterly defeated, he was so grieved that he resigned the
empire. After this the Bulgarians continued to be very
formidable enemies to the empire, till the year 979,
when they were attacked by Basilus II. The Bulgar-
ians were at that time governed by a king named
Samuel; who having ravaged the Roman territories
as was the common practice of his nation, Basilus sent
against him one Nicephorus Uranus at the head of a
powerful army. Uranus, leaving his baggage at La-
rissa, reached by long marches the Sperchius, and
encamped with his whole army over against the en-
emy, who lay on the opposite bank. As the river
was greatly swelled with the heavy rains that had
lately fallen, Samuel, not imagining the Romans would
attempt to pass it, suffered his troops to roam in large
parties about the country in quest of booty. But Uran-
us having at length found out a place where the river
was fordable, passed it in the dead of the night with-
out being perceived. He then fell upon the Bulgari-
ans who were left in the camp, and lay for the most
part asleep; cut great numbers of them in pieces; took
a great number of prisoners, with all their baggage;
and made himself master of their camp. Samuel
and his son were dangerously wounded; and would
have been taken, had they not all that day conceal-
ed themselves among the dead. The next night
they stole away to the mountains of *Ætolia*, and from
thence made their escape into Bulgaria. The follow-
ing year the emperor entered Bulgaria at the head of
a numerous and well-disciplined army; defeated Sa-
muel in a pitched battle, and took several strong cities.
The emperor himself, however, at last, narrowly es-
caped being cut off with his whole army; being unex-
pectedly attacked by the Bulgarians in a narrow pass.

From this danger he was relieved by the arrival of
Nicephorus Xiphias, governor of Philippopolis, with a
considerable body of troops; who falling upon the
enemies rear, put them to flight. Basilus pursued
them close; and having taken an incredible number of
captives, caused their eyes to be pulled out, leaving to
every hundred a guide with one eye, that he might
conduct them to Sammel. This shocking spectacle so
affected the unhappy king, that he fell into a deep
swoon, and died two days after. The Roman emper-
or pursued his conquests, and in the space of two
years made himself master of most of the enemies
strong holds. He defeated also the successor of Sa-
muel in several engagements; and having at last
killed him in battle, the Bulgarians submitted them-
selves without reserve. The vast treasures of their
princes were by Basilus distributed among his soldiers
by way of donative. Soon after, the widow of the
late king, with her six daughters and three of her
sons, surrendered themselves to the Roman emperor,
by whom they were received with the utmost civility
and respect. This obliging behaviour encouraged the
three other sons of the late king, and most of the
princes of the blood, who had taken shelter in the
mountains, to submit, and throw themselves on the
emperor's mercy.

Ibatzes, however, a person nearly allied to the
royal family, who had distinguished himself in a very
eminent manner during the whole course of the war,
refused to submit, and tied to a steep and craggy moun-
tain, with a design to defend himself there to the last
extremity. Basilus endeavoured to cause him submit
by fair means, but he equally despised both threats and
promises. At last Eustathius Daphnomelus, whom
Basilus had lately appointed governor of Achridus,
the chief city of Bulgaria, undertook to secure him by
a most desperate and improbable scheme. Without
communicating his design to any, he repaired, with
two persons in whom he could confide, to the moun-
tain on which Ibatzes had fortified himself. He hoped
to pass undiscovered among the many strangers who
flocked thither to celebrate the approaching feast of
the Virgin Mary, for whom Ibatzes had a particular
veneration. In this he found himself mistaken; for
he was known by the guards, and carried before the
prince. To him he pretended to have something of
importance to communicate; but as soon as Ibatzes
had retired with him into a remote place, Daphnome-
lus threw himself suddenly upon him, and with the as-
sistance of the two men whom he had brought with
him, pulled out both his eyes, and got (ide to an aban-
doned castle on the top of the hill. Here they were
immediately surrounded by the troops of Ibatzes; but
Daphnomelus exhorting them now to submit to the
emperor, by whom he assured them they would be
well received, they congratulated Daphnomelus on his
success, and suffered him to conduct the unhappy
Ibatzes a prisoner to Basilus. The emperor was no
less surprised than pleased at the success of this bold
attempt; and rewarded Daphnomelus with the go-
vernment of Dyrrhachium, and all the rich moveables
of his prisoner. After this, having accomplished the
entire reduction of Bulgaria, he returned to Const-
antinople with an incredible number of captives; where

Constantinopolitan history.

he was received by the senate and people with all possible demonstrations of joy.

All this time, the Saracens had at intervals invaded the Roman dominions, and even attempted to make themselves masters of Constantinople. Their internal divisions, however, rendered them now much less formidable enemies than they had formerly been; so that some provinces were even recovered for a time out of their hands; though the weak and distracted state of the empire rendered it impossible to preserve such conquests. But in 1041, the empire was invaded by an enemy, not very powerful at that time indeed, but who by degrees gathered strength sufficient to overthrow both the Roman and Saracen empires. These were the *Turks*; who having quitted their ancient habitations in the neighbourhood of mount Caucasus, and passed the Caspian freights, settled in Armenia Major, about the year 844. There they continued an unknown and despicable people, till the intestine wars of the Saracens gave them an opportunity of aggrandizing themselves. About the year 1030, Mohammed the son of *Sambracl* sultan of Persia, not finding himself a match for *Pisaris* sultan of Babylon, with whom he was at war, had recourse to the Turks, who sent him 3000 men under the command of one *Tangrolipix* a leading man among them. By their assistance Mohammed defeated his adversary; but when the Turks desired leave to return home, he refused to part with them. Upon this they withdrew without his consent to a neighbouring desert; and being there joined by several discontented Persians, began to make frequent inroads into the sultan's territories. Against them Mohammed immediately dispatched an army of 20,000 men; who, being surprised in the night, were utterly defeated by Tangrolipix. The fame of this victory drew multitudes to him from all parts; so that in a short time Tangrolipix saw himself at the head of 50,000 men. Upon this Mohammed marched against them in person, but was thrown from his horse in the beginning of the engagement and killed by the fall; upon which his men threw down their arms, and submitted to Tangrolipix.

After this victory the Turkish general made war upon the sultan of Babylon; whom he at length slew, and annexed his dominions to his own. He then sent his nephew, named *Cutla-Mofes*, against the Arabians; but by them he was defeated, and forced to fly towards Media. Through this province he was denied a passage by Stephen the Roman governor upon which Cutla-Mofes was obliged to force a passage by encountering the Roman army. These he put to flight, took the governor himself prisoner, and without any further opposition reached the confines of Persia, where he sold Stephen for a slave. Returning from thence to Tangrolipix, he excused, in the best manner he could, his defeat by the Arabians; but at the same time acquainted him with his victory over the Romans in Media, encouraging him to invade that fertile country, which he said might be easily conquered, as it was inhabited by none but *women*, meaning the Romans. At that time Tangrolipix did not hearken to his advice, but marched against the Arabians at the head of a numerous army. He was, however, attended with no better success than his nephew had been; and therefore be-

Vol. III.

gan to reflect on what he had told him. Soon after he sent *Asan* his brother's son with an army of 20,000 men to reduce Media. Pursuant to his orders the young prince entered that country, and committed every where dreadful ravages; but being in the end drawn into an ambush by the Roman generals, he was cut off with his whole army. Tangrolipix, noway discouraged by this misfortune, sent a new army into Media near 100,000 strong; who after having ravaged the country without opposition, laid siege to Artaza a place of great trade, and therefore reckoned the most wealthy in those parts. Not being able to reduce it by any other means, they set it on fire; and thus in a short time it was utterly destroyed: the buildings being reduced to ashes, and 150,000 of the inhabitants perishing either by the flame or the sword. After this *Abraham Halim*, half-brother to Tangrolipix, hearing that the Romans, reinforced with a body of troops under the command of *Liparites* governor of Iberia, had taken the field, marched against them, and offered them battle; which they not declining, the two armies engaged with incredible fury. The victory continued long doubtful; but at length inclined to the Romans; who nevertheless did not think proper to pursue the fugitives, as their general *Liparites* was taken prisoner. The emperor, greatly concerned for the captivity of *Liparites*, dispatched ambassadors with rich presents, and a large sum of money to redeem him, and at the same time to conclude an alliance with Tangrolipix. The sultan received the presents; but generously returned them together with the money to *Liparites*, whom he set at liberty without any ransom; only requiring him, at his departure, never more to bear arms against the Turks. Not long after, Tangrolipix sent a person of great authority among the Turks, with the character of ambassador, to Constantinople; who having arrogantly exhorted the emperor to submit to his master, and acknowledge himself his tributary, was ignominiously driven out of the city.

Tangrolipix, highly affronted at the reception his ambassador had met with, entered Iberia while the emperor Constantine Monomachus was engaged in a war with the *Patzinace*, a Scythian nation. Having ravaged that country, he returned from thence to Media; and laid siege to *Mantzichiarta*, a place defended by a numerous garrison, and fortified with a triple wall and deep ditches. However, as it was situated in an open plain country, he hoped to be master of it in a short time. But finding the besieged determined to defend themselves to the last extremity, he resolved to raise the siege, after he had continued it 30 days. One of his officers, however, named *Alcan*, prevailed on him to continue it but one day longer, and to commit the management of the attacks to him. This being granted, Alcan disposed his men with such skill, and so encouraged them by his example, that, notwithstanding the vigorous opposition they met with, the place would have probably been taken, had not Alcan been slain as he was mounting the wall. The besieged, knowing him by the richness of his armour, drew him by the hair into the city, and cutting off his head threw it over the wall among the enemy; which so disheartened them, that they gave over the assault and retired. The next

Constantinopolitan history. spring Tangrolipix returned, and ravaged Iberia with the utmost cruelty, sparing neither sex nor age. But on the approach of the Roman army he retired to Tauris, leaving 30,000 men behind him to infest the frontiers of the empire. This they did with great success, the borders being through the avarice of Monomachus unguarded. Till the time of this emperor, the provinces bordering on the countries of the barbarians had maintained, at their own charge, forces to defend them; and were on that account exempted from paying tribute: but as Monomachus exacted from them the same sums that were paid by others, they were no longer in a condition to defend themselves.

In 1063 died the emperor Constantine Ducas, having left the empire to his three sons, Michael, Andronicus, and Constantine: but as they were all very young, he appointed the empress Eudocia regent during their minority, after having required of her an oath never to marry; which oath was with great solemnity lodged in the hands of the patriarch. He likewise obliged the senators solemnly to swear that they would acknowledge none for their sovereign but his three sons. No sooner, however, was he dead, than the Turks, hearing that the empire was governed by a woman, broke into Mesopotamia, Cilicia, and Cappadocia, destroying all with fire and sword. The empress was no way in a condition to oppose them, the greater part of the army having been disbanded in her husband's life-time, and the troops that were still on foot being undisciplined, and altogether unfit for service. The concern which this gave the empress, was aggravated by the seditious speeches of a discontented party at home, who repeated, on all occasions, that the present state of affairs required a man of courage and address at the helm, instead of a weak and helpless woman; and as they imagined the empress would never think of marrying, in consequence of the oath she had taken, they hoped by these speeches to induce the people to revolt, and chuse a new emperor. This Eudocia was aware of; and therefore determined to prevent the evils that threatened herself and her family, by marrying some person of merit who was capable of defeating her enemies both at home and abroad. At this time one *Romanus Diogenes*, a person of a most beautiful aspect, extraordinary parts, and illustrious birth, being accused of aspiring to the empire, tried and convicted, was brought forth to receive sentence of death. But the empress, touched with compassion at his appearance, gently upbraided him with his ambition, set him at liberty, and soon after appointed him commander in chief of all her forces. In this station he acquitted himself so well, that the empress resolved to marry him if she could but recover the writing in which her oath was contained out of the hands of the patriarch. In order to this she applied to a favourite eunuch; who going to the patriarch told him, that the empress was so taken with his nephew named *Bardas*, that she was determined to marry and raise him to the empire, provided the patriarch absolved her from the oath she had taken, and convinced the senate of the lawfulness of her marriage. The patriarch, dazzled with the prospect of his nephew's promotion, readily undertook to perform both.

He first obtained the consent of the senate by representing to them the dangerous state of the empire, and exclaiming against the rash oath which the jealousy of the late emperor had extorted from the empress. He then publicly discharged her from it; restored the writing to her; and exhorted her to marry some deserving person, who being entrusted with an absolute authority, might be capable of defending the empire. The empress, thus discharged from her oath, and married a few days after, *Romanus Diogenes*; who was thereupon proclaimed emperor, to the great disappointment of the patriarch.

As the new emperor was a man of great activity and experience in war, he no sooner saw himself vested with the sovereign power, than he took upon him the command of the army, and passed over into Asia with the few forces he could assemble, recruiting and insuring them on his march to military discipline, which had been utterly neglected in the preceding reigns. On his arrival in this continent, he was informed that the Turks had surprised and plundered the city of *Nicaesarea*, and were retiring with their booty. On this news he hastened after them at the head of a chosen body of light-armed troops, and came up with them on the third day. As the Turks were marching in disorder, without the least apprehension of an enemy, *Romanus* cut great numbers of them in pieces, and easily recovered the booty; after which he pursued his march to Aleppo, which he retook from them, together with Hierapolis, where he built a strong castle.

As he was returning to join the forces he had left behind him, he was met by a numerous body of cond victors, Turks, who attempted to cut off his retreat. At first he pretended to decline an engagement through fear; but attacked them afterwards with such vigour when they least expected it, that he put them to flight at the first onset, and might have gained a complete victory had he thought proper to pursue them. After this, several towns submitted to him; but the season being now far spent, the emperor returned to Constantinople. The following year he passed over into Asia early in the spring; and being informed that the Turks had sacked the rich city of Iconium, besides gaining other considerable advantages, he marched in person against them. But the Turks, not thinking it advisable to wait his coming, retired in great haste. The Armenians, however, encouraged by the approach of the emperor's army, fell upon the enemy in the plains of Tarsus, put them to flight, and stripped them both of their baggage and the booty they had taken. The spring following the emperor once more entered Asia at the head of a considerable army which he had raised, and with incredible pains disciplined during the winter. When the two armies drew near to each other, *Axan*, the Turkish Sultan, and son of the famous Tangrolipix, sent proposals to *Romanus* for a lasting and honourable peace. These were imprudently rejected, and a desperate engagement ensued, when, in spite of the utmost efforts of the emperor, his army was routed, and he himself wounded and taken prisoner. When this news was brought to Axan, he could scarcely believe it; but being convinced by the appearance of the royal captive

Constantinopolitan history.

in his presence, he tenderly embraced him, and addressed him in an affectionate manner: "Grieve not, said he, most noble emperor, at your misfortune; for such is the chance of war, sometimes overwhelming one, and sometimes another: you shall have no occasion to complain of your captivity; for I will not use you as my prisoner, but as an emperor." The Turk was as good as his word. He lodged the emperor in a royal pavilion; assigned him attendants, with an equipage suitable to his quality; and discharged such prisoners as he desired. After he had for some days entertained his royal captive with extraordinary magnificence, a perpetual peace was concluded betwixt them, and the emperor dismissed with the greatest marks of honour imaginable. He then set out with the Turkish ambassador for Constantinople, where the peace was to be ratified; but by the way he was informed that Eudocia had been driven from the throne by John the brother of Constantine Ducas, and Piellus a leading man in the senate, who had confined her to a monastery, and proclaimed her eldest son, Michael Ducas, emperor. On this intelligence, Romanus retired to a strong castle near Theodosiopolis, where he hoped in a short time to be joined by great numbers of his friends and adherents. But in the mean time John, who had taken upon him to act as guardian to the young prince, dispatched Andronicus with a considerable army against him. Andronicus having easily defeated the small army which Romanus had with him, obliged him to fly to Adana a city in Cilicia, where he was closely besieged, and at last obliged to surrender. Andronicus carried his prisoner into Phrygia, where he fell dangerously ill, being, as was suspected, secretly poisoned. But the poison being too slow in its operation, John ordered his eyes to be put out; which was done with such cruelty that he died soon after, in the year 1067, having reigned three years and eight months.

132 Eudocia deposed, and confined in a monastery.

133 Romanus put to death.

134 The Turks again invade the empire.

135 They defeat the Romans.

136 They gain a second victory.

Axan was no sooner informed of the tragical end of his friend and ally, than he resolved to invade the empire anew; and that not with a design only to plunder as formerly, but to conquer, and keep what he had once conquered. The emperor dispatched against him Isaac Comnenus, with a considerable army; but he was utterly defeated and taken prisoner by Axan. Another army was quickly sent off under the command of John Ducas the emperor's uncle. He gained at first some advantages, and would probably have put a stop to their conquests, had not one *Rufelius*, or *Urselius*, revolted with the troops he had under his command, caused himself to be proclaimed emperor, and reduced several cities in Phrygia and Cappadocia. Against him John marched with all his forces, and suffering the Turks in the mean time to pursue their conquests; but coming to an engagement with the rebels, his army was entirely defeated, and himself taken prisoner. Notwithstanding this victory, Rufelius was so much alarmed at the progress of the Turks, that he not only released his prisoner, but joined with him against the common enemy, by whom they were both defeated and taken prisoners. Axan, however, was for some time prevented from pursuing his conquests by Cutlu-Moses, nephew to the late Tangrolipix. He had revolted against his uncle; but being defeated by him in

a pitched battle, had taken refuge in Arabia, whence he now returned at the head of a considerable army, in order to dispute the sovereignty with Axan. But while the two armies were preparing to engage, the kalif of Babylon, who was still looked upon as the successor of the great prophet, interposed his authority. He represented the dangers of their intestine dissensions; and by his mediation, an agreement was at last concluded, on condition that Axan should enjoy undisturbed the monarchy lately left him by his father, and Cutlu-Moses should possess such provinces of the Roman empire as he or his sons should in process of time conquer.

After this agreement, both the Turkish princes turned their forces against the empire; and before the year 1077, made themselves masters of all Media, Lycaonia, Cappadocia and Bithynia, fixing the capital quarter of their empire at Nice in the latter province. During all this time, the emperors of Constantinople, as well as their subjects, seemed to be in a manner insatuated. No notice was taken of the great progress made by these barbarians. The generals were ambitious only of seizing the tottering empire, which seemed ready to fall a prey to the Turks; and, after it was obtained, spent their time in oppressing their subjects, rather than in making any attempts to repulse the enemy.

At last Alexius Comnenus, having wrested the empire from Nicephoru, Botoniates in 1077, began to prepare for opposing so formidable an enemy. But before he set out, as his soldiers had committed great outrages on his accession to the empire, he resolved to make confession of his sins, and do open penance for those he had suffered his army to commit. Accordingly he appeared in the attire of a penitent before the patriarch and several other ecclesiastics, acknowledged himself guilty of the many disorders that had been committed by his soldiers, and begged of the patriarch to impose upon him a penance suitable to the greatness of his crimes. The penance enjoined him and his adherents by the patriarch was to fast, lie upon the ground, and practise several other austerities for the space of 40 days. This command was religiously obeyed, and the emperor then began to prepare for war with so much vigour, that Solynian, the Turkish sultan, son and successor to Cutlu-Moses, dispatched ambassadors to Alexius with proposals of peace. These were at first rejected; but the emperor was at last glad to accept them on certain advice, that Robert Guiscard, duke of Puglia and Calabria, was making great preparations against him in the West.

To this expedition, Robert was incited by Michael Ducas. That prince had been deposed by Nicephoru Botoniates, and towards the end of the usurper's reign fled into the West, where he was received by Robert, who was prevailed upon to favour his cause. For this purpose, Robert made great preparations; and these were continued even after the depopulation of Botoniates. He failed with all his forces from Brundisium; and landing at *Bubretum* in Epirus, made himself master of that place, while his son Bohemond with part of the army reduced Anlon, a celebrated port and city in the country now called *Albania*. From thence they advanced to Dyrrhachium, which

they invested both by sea and land; but met with a most vigorous opposition from George Paleologus, whom the emperor had entrusted with the defence of that important place. In spite of the utmost efforts of the enemy, this commander held out till the arrival of the Venetian fleet, by whom Robert's navy commanded by Bohemond was utterly defeated, the admiral himself having narrowly escaped being taken prisoner. After this victory, the Venetians landed without loss of time, and being joined by Paleologus's men, fell upon Robert's troops with such fury, that they destroyed their works, burnt their engines, and forced them back to their camp in great disorder. As the Venetians were now masters at sea, the besieged were supplied with plenty of provisions, while a famine began to rage in the camp of the enemy; and this calamity was soon followed by a plague, which in the space of three months is said to have destroyed ten thousand men. Notwithstanding all these disasters, however, Robert did not abandon the siege: having found means to supply his famished troops with provisions, he continued it with such vigour, that the courage of the besieged began at last to fail them; and Paleologus sent repeated messages to the emperor, acquainting him that he would be obliged to surrender unless very speedily assisted. On this Alexius marched in person to the relief of the city, but was defeated with great loss by Robert. The whole right wing of Alexius's army, finding themselves hard pressed by the enemy, fled to a church dedicated to St Michael, imagining they would there find themselves in a place of safety; but the victorious army pursuing them, set fire to the church, which was burnt to ashes with all who were in it. The emperor himself with great difficulty made his escape, leaving the enemy masters of his camp and all his baggage. Soon after this defeat, the city surrendered; and Alexius being destitute of resources for carrying on the war, seized on the wealth of churches and monasteries, which gave much offence to the clergy, and had like to have occasioned great disturbances in the Imperial city. At the same time, Alexius entering into an alliance with Henry emperor of Germany, persuaded him to invade the dominions of Robert in Italy. At first, Henry met with great success; but was soon overcome, and driven out of that country by Robert. Bohemond, in the mean time, reduced several places in Illyricum; and, having defeated Alexius in two pitched battles, entered Thessaly, and sat down before Larissa. This place, being defended by an officer of great courage and experience in war, held out till the emperor came to its relief. Soon after his arrival, he found means to draw a strong party of Bohemond's men into an ambuscade, and cut them off almost entirely. However, in the battle which was fought a few days after, Bohemond had the advantage; but his troops mutinying and refusing to carry on the war, he was obliged to return to Italy. Alexius taking advantage of his absence, recovered several cities; and being informed that Robert was making great preparations against him, he had recourse once more to the Venetians. By them he was assisted with a powerful fleet, which defeated that of Robert in two engagements; but being soon after surprised by him,

they were defeated with the loss of almost their whole navy. Robert is said to have used his victory with great barbarity, putting many of his prisoners to death with unheard-of torments. The Venetians equipped a second fleet; and joining that of the emperor, fell unexpectedly upon Robert's navy, who were riding without the least apprehension in Buthrotum, sunk most of his ships, and took a great number of prisoners, his wife and younger sons having narrowly escaped falling into their hands. Robert made great preparations to revenge this defeat; but was prevented by death from executing his designs; and, after his decease, his son Roger did not think proper to pursue so dangerous and expensive a war. He therefore recalled his troops, and the places which had been conquered by Robert and Bohemond submitted a-new to the emperor.

This war was scarce ended, when the Scythians passing the Danube, laid waste great part of Thrace, committing every where the greatest barbarities. Against them the emperor dispatched an army under the command of Pacurianus and Brianas. The latter insisted upon engaging the enemy contrary to the opinion of his colleague; and his rashness caused the loss of the greater part of the army, who were cut off by the Scythians, together with the two generals. *Talicius*, an officer who had signalized himself on many occasions, was appointed to command the army in their room. He fell upon the enemy as they lay securely in the neighbourhood of Philippopolis, cut great numbers of them in pieces, and obliged the rest to retire in great confusion. The following spring, however, they returned in such numbers, that the emperor resolved to march against them in person. Accordingly he set out for Adrianople, and from thence to a place called *Lardea*. Here, contrary to the advice of his best officers, he ventured a battle; in which he was utterly defeated with the loss of vast numbers of his men, he himself escaping with the utmost difficulty. The next year he was attended with no better success, his army being entirely defeated, with the loss of his camp and baggage. In the year following, 1084, the emperor retrieved his credit; and gave the Scythians such an overthrow, that very few escaped the general slaughter. Notwithstanding this disaster, however, they again invaded the empire in 1093. To this they were encouraged by an impostor called *Leo*, who pretended to be the eldest son of Romanus Diogenes. The young Prince had been slain in a battle with the Turks; but as the Scythians only wanted a pretence to renew the war, they received the impostor with joy. By a stratagem, however, *Leo* was murdered; and the Scythians being afterwards overthrown in two great battles, were obliged to submit on the emperor's own terms.

Since the year 1083, the war had been carried on with the Turks with various success; but now an association was formed in the West against these infidels, which threatened the utter ruin of the Turkish nation. This was occasioned by the superstition of the Christians, who thought it a meritorious action to venture their lives for the recovery of the Holy Land, possessed at that time by the Turks and Saracens. Had the western princes been properly assisted by the emperors

Constantinople history.

rors of the East in this undertaking, the Turks had undoubtedly been unable to resist them; but so far from this, the Latins were looked upon by them as no less enemies than the Turks: and indeed whatever places they took from the infidels, they never thought of restoring to the emperors of Constantinople, to whom they originally belonged, but erected a number of small independent principalities; which neither having sufficient strength to defend themselves, nor being properly supported by one another, soon became a prey to the Turks. But as these transactions naturally fall to be considered under the History of the *Turks*, we refer to that article for a particular account of them. Here we shall only take notice of the taking of Constantinople by the Latins: an event of such importance as cannot be passed over in silence. The occasion of this revolution was as follows. In the year 1203, happened a dreadful fire at Constantinople, occasioned by some Latin soldiers. These had plundered a mosque, which the Turks residing in Constantinople had been suffered to build there. For this reason they were attacked by the infidels; who being much superior to them in number, the Latins found themselves obliged to set fire to some houses, in order to make their escape with safety. The flame spreading in an instant from street to street, reduced in a short time great part of the city to ashes, with the capacious store-houses which had been built at a vast expence on the quay. The late emperor Isaac Angelus, who had been restored to his throne by the Latins, died soon after their departure from Constantinople, leaving his son Alexius sole master of the empire. The young prince, to discharge the large sums he had promised to the French and Venetians for their assistance, was obliged to lay heavy taxes on his subjects; and this, with the great esteem and friendship shewed to his deliverers, raised a general discontent among the people of Constantinople, who were sworn-enemies to the Latins. This encouraged John Ducas, surnamed *Murtzuphlus*, from his joined and thick eye-brows, to attempt the sovereignty. Unhappily he found means to put his treacherous designs in execution; and strangled the young prince with his own hands. After this he presented himself to the people; told them what he had done, which he pretended was in order to secure their liberties; and earnestly entreated them to choose an emperor who had courage enough to defend them against the Latins that were ready to oppress and enslave them. On this he was instantly saluted emperor by the inconstant multitude; but this usurpation proved the ruin of the city. The Latins immediately resolved to revenge the death of the young prince; and, as they had been so often betrayed and retarded in their expeditions to the Holy Land by the emperors of Constantinople, to make themselves masters of that city, and seize the empire for themselves. In consequence of this resolution they mustered all their forces in Asia, and having crossed the streights, laid siege to Constantinople by sea and land. The tyrant, who was a man of great courage and experience in war, made a vigorous defence. The Latins, however, after having battered the walls for several days together with an incredible number of engines, gave a general assault on the 8th of April 1204. The attack lasted from

break of day till three in the afternoon, when they were forced to retire, after having lost some of their engines, and a great number of men. The assault was nevertheless renewed four days after; when, after a warm dispute, the French planted their standard on one of the towers; which the Venetians observing, they quickly made themselves masters of four other towers, where they likewise displayed their ensigns. In the mean time three of the gates being broke down by the battering rams, and those who had scaled the walls having killed the guards, and opened the gates between the towers they had taken, the whole army entered, and drew up in battle array between the walls. The Greeks fled up and down in the greatest confusion; and several parties were by the Latins dispatched to scour the streets, who put all they met to the sword, without distinction of age or condition. Night put a stop to the dreadful slaughter, when the princes founding the retreat, placed their men in different quarters of the city, with orders to be upon their guard, not doubting but they should be attacked early next morning. They were surprised, however, at that time by the entire submission of the Greeks; to whom they promised their lives, but at the same time, ordering them to retire to their houses, they gave up the city to be plundered by the soldiers for that day. They strictly enjoined their men to abstain from slaughter, to preserve the honour of the women, and to bring the whole booty into one place, that a just distribution might be made according to the rank and merit of each individual. The Greeks had undoubtedly concealed their most valuable effects during the night; many persons of the first rank had escaped, and carried along with them immense treasures; the soldiers had probably, as is usual in all such cases, reserved things of great value for themselves, notwithstanding all prohibitions to the contrary; and yet the booty, without the statues, pictures, and jewels, amounted to a sum almost incredible. As for Murtzuphlus, he made his escape in the night; embarking on a small vessel with *Euphrosyne*, the wife of *Alexius Angelus* a late usurper, and her daughter *Eudoxia*, for whose sake he had abandoned his lawful wife.

Constantinople continued subject to the Latins till the year 1261, when they were expelled by *Alexius Strategopulus*. He was a person of an illustrious family; and, for his eminent services, distinguished with the title of *Cæsar*. He had been sent against Alexius Angelus despot of Epirus, who now attempted to recover some places in Thessaly and Greece from Michael Paleologus, one of the Greek emperors, that, since the capture of Constantinople, had kept their court at Nice; and to try whether he could on his march surprise the imperial city itself. Alexius, having passed the streights, encamped at a place called *Rhégium*, where he was informed by the natives that a strong body of the Latins had been sent to the siege of *Daphnusa*, that the garrison was in great want of provisions, and that it would be no difficult matter to surprise the city. Hereupon the Greek general resolved at all events to attempt it; in which he was encouraged by some of the inhabitants, who, coming privately to his camp, offered themselves to be his guides. He approached the walls in the dead of the night,

which some of his men sealed without being observed ; and, killing the centries whom they found asleep, opened one of the gates to the rest of the army. The Greeks rushing in, put all they met to the sword ; and at the same time, to create more terror, set fire to the city in four different places. The Latins, concluding from thence that the enemy's forces were far more numerous than they really were, did not so much as attempt either to drive them out, or to extinguish the flames. In this general confusion the emperor Baldwin, quitting the enigmis of majesty, fled with Justinian the Latin patriarch, and some of his intimate friends, to the sea-side ; and there, embarking on a small vessel, sailed first to Eubœa, and afterwards to Venice, leaving the Greeks in full possession of Constantinople. When news of this surprising and altogether unexpected success of Alexius were first brought to Paleologus, he could scarce give credit to it ; but receiving soon after letters from Alexius himself, with a particular account of so memorable an event, he ordered public thanks to be returned in all the churches, appeared in public in his imperial robes, attended by the nobility in their best apparel, and ordered couriers to be dispatched with the agreeable news into all parts of the empire.

151
Entry of
Michael
Paleologus
into the
city.

Soon after, having settled his affairs at Nice, he set out for Constantinople with the empress, his son Andronicus, the senate, and nobility, to take possession of the imperial city, and fix his residence in that place that had originally been designed for the seat of the eastern empire. Having passed the freights, he advanced to the *golden gate*, and continued some days without the walls, while the citizens were busied in making the necessary preparations to receive him with a magnificence suitable to the occasion. On the day appointed, the golden gate, which had been long shut up, was opened, and the emperor entering it amidst the repeated acclamations of the multitude, marched on foot to the great palace. He was preceded by the bishop of *Cyzicus*, who carried an image of the Virgin Mary, supposed to have been done by St Luke, and followed by all the great officers, nobility, and chief citizens, pompously dressed. Public thanks were again returned in the church of St Sophia, at which the emperor assisted in person, with the clergy, the senate, and nobility. These exercises were succeeded by all sorts of rejoicings ; after which the emperor carefully surveyed the imperial city. This survey greatly alleviated his joy. He saw the stately palaces and other magnificent buildings of the Roman emperors lying in ruins ; the many capacious buildings that had been erected by his predecessors, at an immense charge, destroyed by fire, and other unavoidable accidents of war ; several streets abandoned by the inhabitants, and choked up with rubbish, &c. These objects gave the emperor no small concern, and kindled in him a desire of restoring the city to its former lustre. In the mean time, looking upon Alexius as the restorer of his country, he caused him to be clad in magnificent robes ; placed with his own hand a crown on his head ; ordered him to be conducted through the city, as it were in triumph ; decreed that for a whole year the name of Alexius should be joined in the public prayers with his own ; and, to perpetuate the memory of so great and glorious an action, he commanded his statue to be

erected on a stately pillar of marble before the church of the Apollides. His next care was to re-people the city, many Greek families having withdrawn from it while it was held by the Latins, and the Latins now preparing to return to their respective countries. The former were recalled home ; and the latter, in regard of the great trade they carried on, were allowed many valuable privileges, which induced them not to remove. The Greeks were allowed to live in one of the most beautiful quarters of the city, to be governed by their own laws and magistrates, and to trade without paying customs or taxes of any kind. Great privileges were likewise granted to the natives of Venice and Pisa, which encouraged them to lay aside all thoughts of removing, and the trade they carried on proved afterwards highly advantageous to the state.

It was not long, however, before these regulations were altered. The emperor being soon after informed that Baldwin, lately expelled from Constantinople, had married his daughter to Charles king of Sicily, and given him, by way of dowry, the imperial city itself, he ordered the Genoese, who were become very numerous, to remove first to Heraclea, and afterwards to Galata, where they continued. As for the Pisans and Venetians, who were not so numerous and wealthy, they were allowed to continue in the city. Paleologus, though he had caused himself to be proclaimed emperor, and was possessed of absolute sovereignty, was as yet only guardian to the young emperor John Lascaris, then about 12 years of age. But having now settled the state, and having gained the affections both of natives and foreigners, he began to think of securing himself and his posterity in the full enjoyment of the empire ; and for this reason cruelly ordered the eyes of the young prince to be put out, pretending that none but himself had any right to the city or empire of Constantinople, which he alone had recovered out of the hand of the Latins.

This piece of treachery and in humanity involved him in great troubles. The patriarch immediately excommunicated him ; and he would in all probability have been driven from the throne by a combination of the western princes, had he not engaged pope Urban IV. to espouse his cause, by promising to submit himself and his dominions to the Latin church. Thus, indeed, he diverted the present storm ; but this proceeding caused the greatest disturbances, not only in Constantinople, but throughout the whole empire, nor was Paleologus able to reconcile his subjects to this union.

In 1283 Michael died, and was succeeded by his son Andronicus. His first step was to restore the ancient Greek ceremonies, thinking he could not begin his reign with a more popular act. But thus he involved himself in difficulties still greater than before. Though Michael had not been able fully to reconcile his Greek subjects to the Latin ceremonies, yet he had in some degree accomplished his purpose. The Latins had got a considerable footing in the city, and defended their ceremonies with great obstinacy ; so that the empire was again thrown into a ferment by this imprudent step.

All this time the Turks had been continuing their encroachments on the empire, which, had it not been for the crusades published against them by the Pope, they

Constantinopolitan history.

they would in all probability have made themselves matters of before this time. They were now, however, very successfully opposed by Constantine the emperor's brother : but his valour rendered him suspected by the emperor; in consequence of which he was thrown into prison, along with several persons of great distinction. On the removal of this brave commander, the Turks, under the famous Othoman, made themselves masters of several places in Phrygia, Caria, and Bithynia; and, among the rest, of the city of Nice. To put a stop to their conquests, the emperor dispatched against them Philanthropus and Libadarius, two officers of great experience in war. The former gained some advantages over the enemy; but being elated with his success, caused himself to be proclaimed emperor. This rebellion, however, was soon suppressed, Philanthropus being betrayed by his own men: but the Turks taking advantage of these intestine commotions, not only extended their dominions in Asia, but conquered most of the islands in the Mediterranean; and, being masters at sea, infested the coasts of the empire, to the utter ruin of trade and commerce.

From this time the Roman empire tended fast to dissolution. After the revolt of Philanthropus, the emperor could no longer trust his subjects, and therefore hired the Massagets to assist him: but they, behaving in a careless manner, were first defeated by their enemies, and afterwards turned their arms against those they came to assist. He next applied to the Catalans, who behaved in the same manner; and having ravaged the few places left the emperor in Asia, returned into Europe, and called the Turks to their assistance.

This happened in the year 1292, and was the first appearance of the Turks in Europe. This enterprise, however, was unsuccessful. Having loaded themselves with booty, they offered to depart quietly if they were allowed a safe passage, and ships to transport them to Asia. To this the emperor, willing to get rid of such troublesome guests, readily consented, and ordered the vessels to be got ready with all possible expedition. But the Greek officers observing the immense booty with which they were loaded, resolved to fall upon them in the night, and cut them all off at once. This scheme, however, was not managed with such secrecy but that the Turks had notice of it, and therefore prepared for their defence. They first surprised a strong castle in the neighbourhood, and then found means to acquaint their countrymen in Asia with their dangerous situation. Their brethren, enticed with the hopes of booty, were not long of coming to their assistance; and having crossed the Hellespont in great numbers, ravaged the adjacent country, making excursions to the very gates of Constantinople. At last the emperor determined to root them out; and accordingly marched against them with all his forces, the country people flocking to him from all quarters. The Turks at first gave themselves over for lost; but finding the Greeks negligent of discipline, they attacked their army unexpectedly, utterly defeated it, and made themselves masters of the camp. After this unexpected victory, they continued for two years to ravage Thrace in the most terrible manner. At last, however, they

were defeated; and being afterwards shut up in the Chersonesus, they were all cut in pieces, or taken.

Soon after new commotions took place in this unhappy empire, of which the Turks did not fail to take the advantage. In 1327 they made themselves masters of most of the cities on the Mæander; and, among the rest, of the strong and important city of Prusa in Bithynia. The next year, however, Othoman, who may justly be styled the founder of the Turkish monarchy, being dead, the emperor laid hold of that opportunity to recover Nice, and some other important places, from the infidels. But these were lost the year following, together with Abydus and Nicomedia; and in 1330 a peace was concluded upon condition that they should keep all their conquests. This peace they observed no longer than served their own purposes; for new commotions breaking out in the empire, they pursued their conquests, and by the year 1357 had reduced all Asia. They next passed the Hellespont under the conduct of Solymán the son, or, as others will have it, the brother of Orchanes, the successor of Othoman, and seized on a strong castle on the European side. Soon after, the Turkish sultan died, and was succeeded by Amurath. He extended the conquests of his predecessors, and in a short time reduced all Thrace, making Adrianople the seat of his empire. Amurath was slain by treachery in a little time after, and was succeeded by his son Bajazet. This prince greatly enlarged his dominions by new conquests. In a short time he reduced the countries of Thessaly, Macedonia, Phocis, Peloponnesus, Mysia, and Bulgaria, driving out the despots or petty princes who ruled there. Elated with his frequent victories, he began to look upon the Greek emperor, to whom nothing was now left but the city of Constantinople and the neighbouring country, as his vassal. Accordingly he sent him an arrogant and haughty message, commanding him to pay a yearly tribute, and send his son Manuel to attend him in his military expeditions. This demand the emperor was obliged to comply with, but died soon after in the year 1392.

Manuel no sooner heard of his father's death than he hastened to Constantinople, without taking leave of the sultan, or acquainting him with the reasons of his sudden departure. At this Bajazet was so highly offended, that he passed with great expedition out of Bithynia into Thrace, ravaged the country adjoining to Constantinople, and at last invested the city itself both by sea and land. In this extremity Manuel had recourse to the western princes; who sent him an army of 130,000 men, under the command of Sigismund king of Hungary, and John count of Nevers. But though the western troops proved at first successful, they were in the end defeated with great slaughter by Bajazet, who then returned to the siege with greater vigour than ever. As he found, however, that the citizens were determined to hold out to the last, he applied to John, the son of Manuel's elder brother, who had a better title to the crown than Manuel himself. With him he entered into a private agreement, by virtue of which Bajazet was to place John upon the throne of Constantinople; on the other hand, John was to deliver up the city to the Turks, and remove the imperial seat to Peloponnesus, which

the sultan promised to relinquish to him and his posterity. At the same time he sent deputies to the inhabitants of Constantinople, offering to withdraw his army, and cease from further hostilities, provided they expelled Manuel and placed John upon the throne. This proposal rent the city into two factions; but Manuel prevented the mischief which were ready to ensue, by a voluntary resignation, upon condition that he should be allowed to retire to whatever place he thought proper with his wife and children.

With this condition John readily complied; and Manuel having received him into the city, and conducted him to the palace, set sail for Venice. From thence he went to the courts of all the western princes, to solicit their assistance against the Turks, whose power was grown formidable to all Europe. He was every where received with the greatest demonstrations of esteem, and promised large supplies; all Christendom being now alarmed at the progress of the infidels.

In the mean time Bajazet did not fail to put John in mind of his promise; but the citizens refusing to comply with such a scandalous treaty, the siege was renewed, and the city assaulted with more fury than ever. When it was already reduced to the last extremity, news were brought the sultan that Tamerlane, the victorious Tartar, having over-run all the East with incredible celerity, had now turned his arms against the Turks, and was preparing to break into Syria. Bajazet alarmed at the danger that threatened him, raised the siege in great haste, and advanced against Tamerlane with a very numerous and well-disciplined army; but the Tartar totally defeated and took him prisoner, after having cut most of his men in pieces; and thus Constantinople was preserved for the present.

But this relief was of short duration. In 1424 the city was again besieged by Amurath II. The inhabitants defended themselves with great bravery; but must in the end have submitted, had not the emperor prevailed upon the prince of Caramania to countenance an impostor and pretender to the Turkish throne. This obliged Amurath to raise the siege, and march with all his forces against the usurper, whom he soon reduced. Having then no other enemies to contend with, he entered Macedon at the head of a powerful army; and having ravaged the country far and near, he took and plundered Thessalonica, as he did also most of the cities of Ætolia, Phocis, and Bœotia. From Greece he marched into Servia; which country he soon reduced. He next broke into the dominions of the king of Hungary, and besieged the strong city of Belgrade; but here he met with a vigorous repulse, no fewer than 15,000 Turks being slain by the Christians in one fall, which obliged the sultan to drop the enterprize and retire.

In his retreat he was attacked by the celebrated John Hunniades, who cut great numbers of his men in pieces, and obliged the rest to fly with precipitation. Not long after he gained a still more complete victory over the enemy in the plains of Transylvania, with the loss of only 3000 of his own men, whereas 20,000 of the Turks were killed on the field of battle, and almost an equal number in the pursuit. Amurath,

who was then at Adrianople, sent an army into Transylvania far more numerous than the former; but they were attended with no better success, being cut off almost to a man by the brave Hungarian. He gained several other victories no less remarkable; but was at last entirely defeated in 1448; and with this defeat ended all hopes of preserving the Roman empire. The unhappy emperor was now obliged to pay an annual tribute of 300,000 aspers to the sultan; and to yield up to him some strong holds which he still held on the Euxine sea. However, as he doubted not but Amurath would soon attempt to become master of the city itself, he renewed the union between the Greek and Latin churches, hoping that this would induce the western princes to assist him in the defence of the city against the Turks. This union produced great disturbances, which the emperor did not long survive, but died in 1448, leaving the empire, now confined within the walls of Constantinople, to his brother Constantine.

Amurath the Turkish sultan died in 1450, and was succeeded by his son Mohammed. In the beginning of his reign he entered into an alliance with Constantine, and pretended a great desire to live in friendship with him and the other Christian princes; but no sooner had he put an end to a war in which he was engaged with Ibrahim king of Caramania, than he built a strong fort on the European side of the Bosphorus, opposite to another in Asia; in both of which he placed strong garrisons. These two castles commanded the Straits; and the former being but five miles from the city, kept it in a manner blocked up. This soon produced a misunderstanding between him and the emperor, which ended in the siege of the city. The siege commenced on the sixth of April 1453. Mohammed's numerous forces covering the plains before it on the land-side, and a fleet of 300 sail blocking it up by sea. The emperor, however, had taken care to secure the haven, in which were three large ships, 20 small ones, and a great number of galleys, by means of a chain drawn across the entrance. Mohammed began the siege by planting batteries as near the city as he could, and raising mounds in several places as high as the walls themselves, whence the besieged were incessantly galled with showers of arrows. He had in his camp a piece of ordnance of prodigious size, which is said to have carried a ball of 100 pounds weight made of hard black stone brought from the Euxine sea. With this vast piece the enemy made several breaches in the walls; which, however, were repaired with incredible expedition by the besieged. But Mohammed, the better to carry on the siege, caused new levies to be made throughout his extensive dominions, by which his army was soon increased to near 400,000 men, while the garrison consisted only of 9000 regular troops, viz. 6000 Greeks and 3000 Genoese and Venetians. As the enemy continued to batter the walls day and night without intermission, a great part of them was at last beaten down; but while the Turks were busy in filling up the ditch, in order to give the assault, a new wall was built. This threw the tyrant into a prodigious rage, which was greatly heightened when he saw his whole fleet worsted by five ships, four of

which were laden with corn from Peloponnesus, and the others with all manner of provisions from the Isle of Chios. These opened themselves a way through the whole Turkish fleet; and, to the inexpressible joy of the Christians, at last got safe into the harbour.

The Turks attempted several times to force the haven; but all their efforts proving ineffectual, Mohammed formed a design of conveying 80 galleys over land for the space of eight miles into it. This he accomplished by means of certain engines, the contrivance of a renegade; and having then either taken or sunk all the ships contained in it, he caused a bridge to be built over it with surprising expedition. By this means the city was laid open to an assault from that side likewise. The place was now assaulted on all sides; and Constantine being well apprised that he could not long hold out against such a mighty fleet and so numerous an army, sent deputies to Mohammed, offering to acknowledge himself his vassal, by paying him yearly what tribute he should think proper to impose, provided he raised the siege and withdrew. The tyrant answered that he was determined at all events to become master of the city: but if the emperor delivered it up forthwith, he would yield up to him Peloponnesus, and other provinces to his brothers, which they should enjoy peaceably as his friends and allies; but if he held out to the last extremity, and suffered it to be taken by assault, he would put him and the whole nobility to the sword, abandon the city to be plundered by his soldiers, and carry the inhabitants into captivity.

This condition was rashly rejected by the emperor; who thereby involved himself and all his subjects in the most terrible calamity. The siege was renewed with more vigour than ever, and continued till the 25th of May, when a report being spread in the Turkish camp, that a mighty army was advancing in full march to the relief of the city, under the conduct of the celebrated John Hunniades, the common soldiers, seized with a panic, began to mutiny, and press Mohammed in a tumultuous manner to break up the siege. Nay, they openly threatened him with death, if he did not immediately abandon the enterprize and retire from before the city, which they despaired of being able to reduce before the arrival of the supposed succours. Mohammed was upon the point of complying with their demand, when he was advised by Zagan, a Turkish officer of great intrepidity, and an irreconcilable enemy to the Christian name, to give without loss of time a general assault. To this he said the soldiery, however mutinous, would not be averse, provided the sultan solemnly promised to abandon the city to be plundered by them. As such an advice best suited the humour of Mohammed, he readily embraced it, and caused a proclamation to be published throughout the camp, declaring, that he gave up to his soldiers all the wealth of that opulent city, requiring for himself only the empty houses.

The desire of plunder soon got the better of that fear which had seized the Turkish army; and they unanimously desired to be led on to the attack. Hereupon Constantine was summoned for the last time to deliver up the city, - with a promise of his life and li-

Vol. III.

berty: but to this he answered, that he was unalterably determined either to defend the city or to perish with it. The attack began at three in the morning on Tuesday the 29th of May; such troops were first employed as the sultan valued least, and designed them for no other purpose than to tire the Christians, who made a prodigious havock of that disorderly multitude. After the carnage had lasted some hours, the Janizaries and other fresh troops advanced in good order, and renewed the attack with incredible vigour. The Christians, summoning all their courage and resolution, twice repelled the enemy: but being in the end quite spent, they were no longer able to stand their ground; so that the enemy in several places broke into the city. In the mean time Justiniani, the commander of the Genoese and a select body of Greeks, having received two wounds, one in the thigh and the other in the hand, was so disheartened, that he caused himself to be conveyed to Galata, where he soon after died of grief. His men, dismayed at the sudden flight of their general, immediately quitted their posts and fled in the utmost confusion. However, the emperor, attended by a few of the most resolute among the nobility, still kept his post, striving with unparalleled resolution to oppose the multitude of barbarians that now broke in from every quarter. But being in the end overpowered with numbers, and seeing all his friends lie dead on the ground, "What! (cried he aloud), is there no Christian left alive to strike off my head?" He had scarce uttered these words, when one of the enemy, not knowing him, gave him a deep cut across the face with his sabre; and at the same time, another coming behind him, with a blow on the back part of his head, laid him dead on the ground. After the death of the emperor, the few Christians that were left alive betook themselves to flight; and the Turks, meeting with no further opposition, entered the city, which they filled with blood and slaughter. They gave no quarter, but put all they met to the sword, without distinction. Many thousands took refuge in the church of St Sophia; but they were all massacred in their asylum by the enraged barbarians, who, prompted by their natural cruelty, the desire of revenge, and love of booty, spared no place nor person. Most of the nobility were, by the sultan's orders, cut off, and the rest kept for purposes more grievous than death itself. Many of the inhabitants, among whom were some men of great learning, found means to make their escape, while the Turks were busied in plundering the city. These embarking on five ships then in the harbour, arrived safe in Italy; where, with the study of the Greek tongue, they revived the liberal sciences, which had long been neglected in the West. After the expiration of three days, Mohammed commanded his soldiers to forbear all further hostilities on pain of death; and then put an end to as cruel a pillage and massacre as any mentioned in history. The next day he made his public and triumphal entry into Constantinople, and chose it for the seat of the Turkish empire, which it has continued to be ever since.

This city is now called by the Turks *Istampol*, and by the Greeks *Istampoli* or *Stampoli*. It is seated at the eastern extremity of Romania, on a small neck of

tion
Constella-
tion.

land, which advances towards Natolia, from which it is separated by a channel of a mile in breadth. The sea of Marmora washes its walls on the south, and a gulph of the channel of Constantinople does the same on the north. It is delightfully situated between the Black-sea and the Archipelago, from whence it is supplied with all necessities. The grand Seigneur's palace, called the Seraglio, is seated on the sea-side, and is surrounded with walls flanked with towers, and separated from the city by canals. It is said the harbour will easily hold 1200 ships. The number of houses must needs be prodigious, since one fire has burnt down 30,000 in a day, without greatly changing the aspect of the city. However, in general, they are but mean, especially on the out-side, where there are few or no windows, and the streets being narrow, gives them a melancholy look. They reckon that there are 3770 streets, small and great: but they are seldom or never clean; and the people are infected with the plague almost every year. The inhabitants are half Turks, two thirds of the other half Christians, and the rest Jews. Here are a great number of ancient monuments still remaining, and particularly the superb temple of Sophia, which is turned into a mosque, and far surpasses all the rest. The street called Adrianople, is the longest and broadest in the city; and the bazars, or bezeiteins, are the markets for selling all sorts of merchandize. The old and the new are pretty near each other; and are large square buildings, covered with domes, and supported by arches and pilasters. The new is the best, and contains all sorts of goods, which are there exposed to sale. The market for slaves, of both sexes, is not far off; and the Jews are the principal merchants, who bring them here to be sold. There are a great number of young girls brought from Hungary, Greece, Candia, Russia, Mingrelia, and Georgia, for the service of the Turks, who generally buy them for their seraglios. The great square, near the mosque of Sultan Bajazet, is the place for public diversions, where the jugglers and mountebanks play a great variety of tricks. The circumference of this city is by some said to be 15 miles, and by Mr Tournesfort 23 miles; to which, if we add the suburbs, it may be 34 miles in compass. The suburb called Pera, is charmingly situated; and is the place where the ambassadors of England, France, Venice, and Holland, reside. This city is built in the form of a triangle; and as the ground rises gradually, there is a view of the whole town from the sea. The public buildings, such as the palaces, the mosques, bagnios, and caravansaries for the entertainment of strangers, are many of them very magnificent. E. Long. 29. 20. N. Lat. 41. 4.

CONSTELLATION, in astronomy, a system of several stars that are seen in the heavens, near to one another. Astronomers not only mark out the stars, but, that they may better bring them into order, they distinguish them by their situation and position in respect to each other; and therefore they distribute them into asterisms, or constellations, allowing several

stars to make up one constellation: and for the better distinguishing and observing them, they reduce the constellations to the forms of animals, as men, bulls, bears, &c. or to the images of some things known, as of a crown, a harp, a balance, &c.; or give them the names of those whose memories, in consideration of some notable exploit, they had a mind to transmit to future ages.

The division of the stars by images and figures is of great antiquity, and seems to be as old as astronomy itself: for in the most ancient book of Job, Orion, Arcturus, and the Pleiades, are mentioned; and we meet with the names of many of the constellations in the writings of the first poets, Homer and Hesiod.

The ancients, in their division of the firmament, took in only so much as came under their notice, distributing it into 48 constellations; but the modern astronomers comprehend the whole starry firmament, dividing it into three regions. See *АСТРОНОМІЯ*, n^o 203, &c.

CONSTIPATION, in medicine, a hardness of the belly, with great costiveness. See *COSTIVENESS*.

CONSTITUENT PART, in physiology, an essential part in the composition of any thing, differing little from what is otherwise called *element* or *principle*.

CONSTITUTION, in matters of policy, signifies the form of government established in any country or kingdom.

CONSTITUTION also denotes an ordinance, decision, regulation, or law, made by authority of any superior, ecclesiastical or civil.

Apollitical CONSTITUTIONS, a collection of regulations attributed to the apostles, and supposed to have been collected by St Clement, whose name they likewise bear.

It is the general opinion, however, that they are spurious, and that St Clement had no hand in them. They appeared first in the IVth age, but have been much changed and corrupted since that time. They are divided into eight books, consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly the ceremonies and discipline of the church. Mr Whiston, in opposition to the general opinion, asserts them to be a part of the sacred writings, dictated by the apostles in their meetings, and wrote down from their own mouth by St Clement; and intended as a supplement to the New Testament, or rather as a system of Christian faith and polity. The reason why the Constitutions are suspected by the orthodox, and perhaps the reason also why their genuineness is defended by Mr Whiston, is, that they seem to favour Arianism.

CONSTITUTION, in a physical sense, signifies the particular temperature of the body.

It is curious to observe, says Dr Percival, the revolution which hath taken place, within this century, in the constitutions of the inhabitants of Europe. Inflammatory diseases more rarely occur, and, in general, are much less rapid and violent in their progress than formerly*, nor do they admit of the same antiphlogistic method

* The decrease in the violence of inflammatory diseases may perhaps in part be ascribed to the present improved method of treating them. Moderate evacuations, cool air, astringent diet, and the liberal use of saline and antimonial medicines, are better adapted to check the progress of fevers, than copious bleedings, stimulating purgatives, and profuse sweats, excited by iacacia and mithridate.

Constitution
↑
Construction.

method of cure that was practised with success 100 years ago. The experienced Sydenham makes 40 ounces of blood the mean quantity to be drawn in the acute rheumatism; whereas this disease, as it now appears in the London hospitals, will not bear above half that evacuation. Vernal intermittents are frequently cured by a vomit and the bark, without venesection; which is a proof that at present they are accompanied with fewer symptoms of inflammation than they were wont to be. This advantageous change, however, is more than counterbalanced by the introduction of a numerous class of nervous ailments, in a great measure unknown to our ancestors; but which now prevail universally, and are complicated with almost every other distemper. The bodies of men are enfeebled and enervated; and it is not uncommon to observe very high degrees of irritability, under the external appearance of great strength and robustness. The hypochondria, palfies, cachexies, dropsies, and all those diseases which arise from laxity and debility, are in our days endemic every where; and the hysterics, which used to be peculiar to the women, as the name itself indicates, now attack both sexes indiscriminately. It is evident that so great a revolution could not be effected without a concurrence of many causes; but amongst these, (according to Dr Percival), the present general use of tea* holds the first and principal rank. The second place may perhaps be allowed to excess in spirituous liquors. This pernicious custom, in many instances at least, owes its rise to the former, which, by the lowness and depression of spirits it occasions, renders it almost necessary to have recourse to something cordial and exhilarating. And hence proceed those odious and disgraceful habits of intemperance, with which many of the softer sex are now, alas! chargeable.

CONSTRUCTOR, an appellation given to several muscles, on account of their constringing or closing some of the orifices of the body.

CONSTRUCTION, in geometry, is the drawing such lines, such a figure, &c. as are previously necessary for making any demonstration appear more plain and undeniable.

CONSTRUCTION of Equations. See **EQUATIONS**.

CONSTRUCTION, in grammar; syntax, or the arranging and connecting the words of a sentence according to the rules of the language. See **GRAMMAR**, and **LANGUAGE**.

The construction is generally more simple, easy, and direct, in the modern tongues than in the ancient: we have very few of those inversions which occasion so much embarrassment and obscurity in the Latin; our thoughts are usually delivered in the same order wherein the imagination conceives them: the nominative case, for instance, always precedes the verb, and the verb goes before the oblique cases it governs.

The Greeks and Latins, M. St Evremont observes, usually end their periods, where, in good sense and reason, they should have begun; and the elegance of their language consists, in some measure, in this capricious arrangement, or rather in this transposal and disorder of the words. See **LANGUAGE**.

CONSTRUCTION of Statutes among lawyers. See **LAW**, Part II. n° 49.

Consualia
↑
Consul.

CONSUALIA, feasts held among the ancients, in honour of the god *Consus*, i. e. Neptune; different from those other feasts of the same deity called *Neptunalia*. They were introduced with a magnificent cavalcade, or procession on horseback; by reason Neptune was reputed to have first taught men the use of horses; whence his surname of *Neptunus, equitarius*. Evander is said to have first instituted this feast: it was re-established by Romulus, under the name of *Consus*; in regard it was some god under the denomination of *Consus*, who (he pretended) suggested to him the rape of the Sabines. See **ROME**.

CONSUBSTANTIATION, a tenet of the Lutheran church with regard to the manner of the change made in the bread and wine in the eucharist. The divines of that profession maintain, that after consecration, the body and blood of our Saviour are substantially present, together with the substance of the bread and wine, which is called consubstantiation, or impanation.

CONSUL, the chief magistrate of the Roman commonwealth. They were two in number, chosen every year in the Campus Martius, by the people assembled in the comitia centuriata. In the first times of the commonwealth, no man could pretend to this dignity, but such as were of a patrician family; but afterwards the people obtained, that one of the consuls should be chosen from among them. A consul was commonly chosen at 43 years of age, but this was not always observed: besides, it was requisite he should have exercised other offices, as that of *quaestor*, *aedile*, and *praetor*: and yet this condition was no better observed than the first; for Pompey had never been *praetor* nor *quaestor* when he obtained the consulship. Their authority and power was of very great extent, so long as the commonwealth subsisted. They were the head of the senate: they commanded the armies, and were supreme judges of the differences between the citizens; but as they had made some abuse of this power, it was allowed by the Valerian law for the party aggrieved to appeal from their tribunal to the people, especially in cases where the life of a citizen was concerned. Under the emperors, consul was little more than an honourable title, and at last it became absolutely extinct in the time of Justinian. From the establishment of the republic to the consulate of Basil, that is, from the year of Rome 244, to the year of Rome 1294, the years are accounted by the consuls; but after that period, the time was computed by the years of the emperors reigns and the indictions.

CONSUL, at present, is an officer established by virtue of a commission from the king and other princes, in all foreign countries of any considerable trade, to facilitate and dispatch business, and protect the merchants of the nation. The consuls are to keep up a correspondence with the ministers of England residing in the courts whereon their consulate depends. They are to support the commerce and the interest of the nation; to dispose of the sums given and the presents made to the lords and principals of places, to obtain their protection, and prevent the insults of the natives on the merchants of the nation.

CONSUMMATION, the end, period, or completion

Consumption
|
Continent.

of any work. Thus, we say, the *consummation* of all things, meaning the end of the world. By the incarnation, all the prophecies are said to be *consummated*. See PROPHECY, and ACCOMPLISHMENT.

Consummation of marriage, denotes the last act of marriage, which makes its accomplishment; or the most intimate union between the married pair, &c.

CONSUMPTION, in medicine, a word of very extensive signification, implies all disorders that bring any decay or waste upon the constitution; but is most commonly used for the *phthisis pulmonalis*. See (the *Index* subjoined to) MEDICINE.

CONSUMPTION, in fariery. See FARIERY, § viii.

CONSUS, the pagan god of counsel. He had an altar under ground in the great circus at Rome, to shew that counsel ought to be kept secret.

CONTACT, is when one line, plane, or body, is made to touch another; and the parts that do thus touch are called the *points* or *places of contact*.

CONTAGION, in phycic, the communicating a disease from one body to another. In some diseases it is only effected by an immediate contact or touch, as the venom of the pox; in others, it is conveyed by infected cloaths, as the itch; and in others, it is transmitted through the air at a considerable distance, by means of steams or effluvia expiring from the sick, as in the plague and other pellilential disorders, in which case the air is said to be contagious.

CONTEMPLATION, an act of the mind, whereby it applies itself to consider and reflect upon the works of God, nature, &c.

CONTEMPORARY, a person or thing that existed in the same age with another. Thus, Socrates, Plato, and Aristophanes, were contemporaries.

CONTEMPT, in a general sense, the act of despising, or the state of being despised.

CONTEMPT, in law, is a disobedience to the rules and orders of a court, which hath power to punish such offence; and as this is sometimes a greater, and sometimes a lesser offence, so it is punished with greater or less punishment, by fine, and sometimes by imprisonment.

CONTENT, in geometry, the area or quantity of matter or space included in certain bounds.

CONTESSA, a port-town of Turkey, in Europe, in the province of Macedonia, situated on a bay of the Archipelago, about 200 miles west of Constantinople. E. Long. 25. o. N. Lat. 41. o.

CONTEXT, among divines and critics, that part of scripture or of a writing that precedes and follows the text.

CONTI, a town of Picardy in France, with the title of a principality. It is seated on the river Seille, in E. Long. 2. 17. N. Lat. 49. 54.

CONTIGUITY, in geometry, is when the surface of one body touches that of another.

CONTIGUOUS, a relative term understood of things disposed to near each other, that they join their surfaces or touch. The houses in ancient Rome were not contiguous as ours are, but all insulated.

CONTINENT, in general, an appellation given to things continued without interruption; in which sense we say, *continent fever*, &c.

CONTINENT, in geography, a great extent of land

not interrupted by seas, in contradistinction to island and peninsula, &c. See GEOGRAPHY.—Sicily is said to have been anciently torn from the continent of Italy; and it is an old tradition, which some of our antiquaries still have a regard to, that Britain was formerly a part of the continent of France.

The world is usually divided into two great continents, the old and the new. Whether there exists, in the *southern hemisphere*, another continent, or the whole be only an immense watery region, is a question that for near three centuries has engaged the attention of the learned as well as the commercial world, and given rise to many interesting voyages and discoveries; concerning which, see the article SOUTH SEA.

CONTINGENT, something casual or unusual. Hence future contingent, denotes a conditional event which may or may not happen, according as circumstances fall out.

CONTINGENT, is also a term of relation for the quota that falls to any person upon a division. Thus each prince of Germany in time of war is to furnish so many men, so much money, and munition, for his contingent.

CONTINUED, or CONTINUAL, in a general sense, means incessant, or proceeding without interruption.

CONTINUED Fever, is such a one as sometimes remits, but never intermits or goes entirely off till its period.

CONTINUED Bass, in music, thus called, says Rousseau, because it is continued through the whole piece. Its principal use, besides that of regulating the harmony, is to support the voice and preserve the tone. They pretend that it was one *Ludovico Viana*, of whom a treatise still remains, who towards the end of the last century first put the continued bass in practice. See MUSIC, Art. 204.

CONTINUED Proportion, in arithmetic, is that where the consequent of the first ratio is the same with the antecedent of the second; as 4 : 8 :: 8 : 16; in contradistinction to discrete proportion.

CONTINUITY, is defined by some schoolmen the immediate cohesion of parts in the same quantum; by others, a mode of body, whereby its extremities become one; and by others, a state of body resulting from the mutual implication of its parts. There are two kinds of continuity, mathematical and physical. The first is merely imaginary, since it supposes real or physical parts where there are none. The other, or physical continuity, is that state of two or more particles, in which their parts are so mutually implicated as to constitute one uninterrupted quantity or continuum.

CONTINUO, in music, signifies the thorough bass, as *basso continuo* is the continual or thorough bass, which is sometimes marked in music-books by the letters B. C.

CONTOR, CONDOR, or CUNTUR, the American name of a species of VULTUR.

CONTORSION, in general, signifies the action of twisting or wrestling a member of the body out of its natural situation. Rope-dancers accustom themselves to contorsions of their limbs from their youth, to render the fibres of their articulations lax, and supple to all kinds of postures.

Contingent
|
Contortion.

Conson
Contract.

Contractile
Contract.

CONTORSION, in medicine, has many significations. 1. It denotes the iliac passion. 2. An incomplete dislocation, when a bone is in part, but not entirely, forced from its articulation. 3. A dislocation of the vertebrae of the back side-ways, or a crookedness of these vertebrae. And, 4. A disorder of the head, in which it is drawn towards one side, either by a spasmodic contraction of the muscles on the same side, or a palsy of the antagonist muscles on the other.

CONTORTÆ, the name of the 30th order in Linnaeus's Fragments of a natural method, consisting of plants which have a single petal that is twisted or bent to one side. This order contains the following genera, viz. echites, cerbera, gardenia, genipa, microcnemum, nerium, periplocia, rawolfia, tabernaemontana, vinca, apocynum, asclepias, comararia, ceropogia, cynanchum, plumeria, stapelia.

CONTOUR, in painting, the outline, or that which defines a figure.

A great part of the skill of the painter lies in managing the contours well. Contour, with the Italian painters, signifies the lineaments of the face.

CONTOURNE, in heraldry, is used when a beast is represented standing or running with its face to the sinister side of the escutcheon, they being always supposed to look to the right, if not otherwise expressed.

CONTOURNIATED, a term among antiquaries applied to medals, the edges of which appear as if turned in a lath. This sort of work seems to have had its origin in Greece; and to have been designed to perpetuate the memories of great men, particularly those who had bore away the prize at the solemn games. Such are those remaining of Homer, Solon, Euclid, Pythagoras, Socrates, and several athletes.

CONTRABAND, in commerce, a prohibited commodity, or merchandise bought or sold, imported or exported, in prejudice to the laws and ordinances of a state, or the public prohibitions of the sovereign. Contraband goods are not only liable to confiscation themselves, but also subject all other allowed merchandise found with them in the same box, bale or parcel, together with the horses, waggons, &c. which conduct them. There are contrabands likewise, which, besides the forfeiture of the goods, are attended with several penalties and disabilities.

CONTRACT, in a general sense, a mutual consent of two or more parties, who voluntarily promise and oblige themselves to do something; pay a certain sum, or the like. All donations, exchanges, leases, &c. are so many different contracts.

CONTRACT is particularly used in common law, for an agreement or covenant between two, with a lawful consideration or cause. As, if I sell my horse for money; or covenant, in consideration of L. 20, to make you a lease of a farm; these are good contracts, because there is *quid pro quo*.

Usurious CONTRACT, is a contract to pay more interest for money than the laws allow. See **USURY**.

Those contracts are said to be *null* which the law prohibits the making of; such are all contracts between persons incapable of contracting, as minors, religious, lunatics, wives without consent of their husbands, &c.

CONTRACT is also used for the instrument in writ-

ing, which serves as a proof of the consent granted, and the obligation passed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were wrote, either by the parties themselves, or by one of the witnesses, or by a domestic secretary of one of the parties, whom they called a *notary*, but who was no public person as among us.

The contract, when finished, was carried to the magistrate, who gave it a public authority by receiving it *inter actus*, into the number of acts under his jurisdiction; giving each of the parties a copy thereof, transcribed by his clerks or domestic registers, and sealed with his seal. Which practice passed into France, where it obtained a long time.

CONTRACTILE FORCE, that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up again to their former dimensions.

CONTRACTION, in grammar, is the reducing of two syllables into one, as *can't* for *cannot*, *should'st* for *shouldest*, &c.

CONTRACTION, in physics, the diminishing the extent or dimensions of a body, or the causing its parts to approach nearer to each other, in which sense it stands opposed to dilatation or expansion.

CONTRADICTION, a species of direct opposition, wherein one thing is found diametrically opposite to another.

CONTRADICTIONARY PROPOSITIONS, are opposites, one of which imports a mere and naked denial of the other.

Seeming contradictions are when the members of a period quite disagree in appearance and sound, but perfectly agree and are consistent in sense: thus,

"Towards die many times before their death;

"The valiant never taste of death but once."

SHAKESPEARE.

CONTRA-FISSURE, in surgery, a kind of fracture, or fissure, in the cranium, which sometimes happens on the side opposite to that which received the blow, or, at least, at some distance from it.

CONTRARIETY, an opposition between two things, which imports their being contrary to one another; and consists in this, that one of the terms implies a negation of the other, either mediately or immediately; so that contrariety may be said to be the contrast, or opposition of two things, one of which imports the absence of the other, as love and hatred.

CONTRARY, a positive opposite, which, subsisting by turns in the same subject with its opposite, is as remote from it as possible, expels it, and is mutually expelled by it. Blackness and whiteness, cold and heat, are such contraries.

CONTRAST; opposition or dissimilitude of figures, by which one contributes to the visibility or effect of the others. See **RESSEMBLANCE**.

CONTRAST, in painting and sculpture, expresses an opposition or difference of position, attitude, &c. of two or more figures, contrived to make variety in a painting, &c. as where, in a groupe of three figures, one is shewn before, another behind, and another side-ways, they are said to be in contrast.

The contrast is not only to be observed in the position of several figures, but also in that of the several members

Contrast
Controller.

Controller
Converging

members of the same figure : thus, if the right arm advance farthest, the right leg is to be hindermost ; if the eye be directed one way, the arm to go the contrary way, &c. The contrast must be pursued even in the drapery.

CONTRAST, in architecture, is to avoid the repetition of the same thing, in order to please by variety.

CONTRATE-WHEEL, in watch-work, that next to the crown, the teeth and hoop whereof lie contrary to those of the other wheels, from whence it takes its name. See WATCH-MAKING.

CONTRAVALLATION, or the *Line CONTRAVALLATION*, in fortification, a trench guarded with a parapet, and usually cut round about a place by the besiegers, to secure themselves on that side, and to stop the sallies of the garrison. See FORTIFICATION.

CONTRAVENTION, in law, a man's failing to discharge his word, obligation, duty, or the laws or customs of the place.

CONTRAYERVA, in botany. See DORSTENIA.

CONTRE, in heraldry, an appellation given to several bearings, on account of their cutting the shield contrary and opposite ways : thus we meet with contre-bend, contre-chevron, contre-pale, &c. when there are two ordinaries of the same nature opposite to each other, so as colour may be opposed to metal, and metal to colour.

CONTRIBUTION, the payment of each person's quota, or the part he is to bear in some imposition, or common expence. See CONTINGENT, &c.—Contributions are either involuntary, as those of taxes and imposts ; or voluntary, as those of expences for carrying on some undertaking for the interest of the community.

CONTRIBUTIONS, in a military sense, are impositions paid by frontier countries to secure themselves from being plundered, and ruined by the enemy's army. The peasants till their ground under the faith of contributions, as securely as in time of profound peace.

CONTRITION, in theology, a sorrow for our sins, resulting from the reflection of having offended God, from the sole consideration of his goodness, without any regard to the punishment due to the trespass, and attended with a sincere resolution of reforming them. The word is derived from the Latin *contrerere*, to break or bruise.

CONTROL is properly a double register kept of acts, issues, &c. of the officers or commissioners in the revenue, army, &c. in order to perceive the true state thereof, and to certify the truth, and the due keeping of the acts subject to the enregistrement.

CONTROLLER, an officer appointed to control or oversee the accounts of other officers ; and, on occasion, to certify whether or no things have been controlled or examined.

In Britain we have several officers of this name ; as controller of the king's house, controller of the navy, controller of the customs, controller of the mint, &c.

CONTROLLER of the *Hanaper*, an officer that attends the lord chancellor daily, in term and in seal-time, to take all things sealed in leathern bags from

the clerks of the hanaper, and to make the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the same, and to charge the clerk of the hanaper with them.

CONTROLLER of the *Pipe*, an officer of the exchequer, that makes out a summons twice every year, to levy the farms and debts of the pipe. See PIPE, and EXCHEQUER.

CONTROLLERS of the *Pells*, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and goings out.

CONTUMACY, in law, a refusal to appear in court when legally summoned, or the disobedience to the rules and orders of a court, having power to punish such offence.

CONTUSION, in medicine and surgery, any hurt of the body that is inflicted by a blunt instrument. See SURGERY.

CONVALLARIA, or *LILY of the Valley*, in botany, a genus of the hexandria order, belonging to the monogynia class of plants. The species are eight, three of which are natives of Britain, viz. the majalis, or may-lily ; the multiflora, or solomon's-seal ; and the polygonatum, or sweet-smelling solomon's-seal. They are plants of considerable beauty, and may easily be propagated by their creeping roots.

CONVENT, in church-history. See MONASTERY.

CONVENTICLE, a private assembly or meeting for the exercise of religion. The word was first attributed as an appellation of reproach to the religious assemblies of Wickliffe in the reigns of Edward III. and Richard II. There were several statutes made in former reigns, for the suppression of conventicles ; but, by 1 William and Mary, it is ordered, that dissenters may assemble for the performance of religious worship, provided their doors be not locked, barred, or bolted.

CONVENTION, a treaty, contract, or agreement between two or more parties.

CONVENTION is also a name given to an extraordinary assembly of parliament, or the estates of the realm, held without the king's writ ; as was the convention of estates, who, upon the retreat of king James II. came to a conclusion that he had abdicated the throne, and that the right of succession devolved to king William and queen Mary ; whereupon their assembly expired as a convention, and was converted into a parliament.

CONVENTUAL, something belonging to a convent or monastery. See MONASTERY, and COENOBITE.

CONVENTUAL is particularly used for a religious who actually resides in a convent ; in contradistinction to those who are only guests, or are entertained there, or in possession of benefices depending on the house. See MONK.

CONVERGING, or CONVERGENT *Lines*, in geometry, are such as continually approach nearer one another, or whose distances become still less and less. These are opposed to divergent lines, the distances of which become continually greater : those lines which converge one way, diverge the other.

CONVERGING *Rays*, in optics, those rays that, issuing

converse
conviction.

fuings from divers points of an object, incline towards another, till, at last, they meet and cross, and then become diverging rays.

CONVERSE, in mathematics. One proposition is called the *converse* of another, when, after a conclusion is drawn from something supposed in the converse proposition, that conclusion is supposed; and then, that which in the other was supposed, is now drawn as a conclusion from it: thus, when two sides of a triangle are equal, the angles under these sides are equal; and, on the converse, if these angles are equal, the two sides are equal.

CONVERSION, in a moral sense, implies a repentance for a temper and conduct unworthy our nature, and unbecoming our obligations to its Author, and a resolution to act a wiser and a better part for the future.

CONVERSION, in war, a military motion whereby the front of a battalion is turned where the flank was, in case the battalion is attacked in the flank.

CONVERSION of Equations, the same with reduction of equations by multiplication. See **ALGEBRA**, n^o 17.

CONVEX, an appellation given to the exterior surface of gibbous or globular bodies; in opposition to the hollow inner surface of such bodies, which is called *concave*: thus we say, a convex frieze, lens, mirror, superficies, &c.

CONVEXITY, the exterior surface of a convex, *i. e.* gibbous and globular thing; in opposition to concavity, or the inner surface, which is hollow or depressed. See **CONCAVE**.

The word is of particular import in catoptrics and dioptrics; where it is applied to mirrors and lenses.

A convex mirror represents its images smaller than the objects; as a concave one represents them larger: a convex mirror reflects the rays from it, diverging; and therefore disperses and weakens their effect: as a concave one reflects them converging, so as they concur in a point, and have their effect increased: and by how much the mirror is a portion of a smaller sphere, by so much does it diminish the objects, and disperse the rays the more. See **MIRROR**.

A convex lens is either convex on both sides, called a *convexo-convex*; or it is plain on one side, and convex on the other, called a *plano-convex*: or concave on one side, and convex on the other, called a *convexo-concave*, or *concavo-convex*; as the one or the other surface prevails, *i. e.* as this or that is a portion of a smaller sphere. All convex lenses infect the rays of light in their passage, *i. e.* send them out from their convex surface converging, so as that they concur in a point or focus. Hence all convex lenses magnify, *i. e.* represent their images larger than their objects; and this the more, as they are portions of smaller spheres.

CONVEYANCE, in law, a deed or instrument that passes land, &c. from one person to another.

CONVICT, in common law, a person that is found guilty of an offence by the verdict of a jury. See the following article.

CONVICTION, in theology, expresses the first degree of repentance, wherein the sinner becomes

sensible of his guilt, of the evil nature of sin, and of Conviction. the danger of his own ways.

CONVICTION, in law. When a jury has given a verdict upon trial, finding the prisoner guilty, he is said to be *convicted* of the crime whereof he stands indicted. See **TRIAL**.

When the offender is thus convicted, there are two collateral circumstances that immediately arise. 1. On a conviction in general for any felony, the reasonable expences of prosecution are by statute 25 Geo. II. c. 36. to be allowed the prosecutor out of the county-stock, if he petitions the judge for that purpose; and by statute 27 Geo. II. c. 3. poor persons, bound over to give evidence, are likewise entitled to be paid their charges, as well without conviction as with it. 2. On a conviction of larciny in particular, the prosecutor shall have restitution of his goods by virtue of the statute 21 Hen. VIII. c. 11. For by the common law there was no restitution of goods upon an indictment; because it is at the suit of the king only; and therefore the party was enforced to bring an appeal of robbery, in order to have his goods again. But, it being considered that the party prosecuting the offender by indictment, deserves to the full as much encouragement as he who prosecutes by appeal, this statute was made, which enacts, that if any person be convicted of larciny by the evidence of the party robbed, he shall have full restitution of his money, goods and chattels, or the value of them out of the offender's goods, if he has any, by a writ to be granted by the justices. And the construction of this act having been in great measure conformable to the law of appeals, it has therefore in practice superseded the use of appeals of larciny. For instance, as formerly upon appeals, so now upon indictments of larciny, this writ of restitution shall reach the goods so stolen, notwithstanding the property of them is endeavoured to be altered by sale in market overt. And though this may seem somewhat hard upon the buyer, yet the rule of law is, that *spoliatus debet ante omnia restitui*, especially when he has used all the diligence in his power to convict the felon. And, since the case is reduced to this hard necessity, that either the owner or the buyer must suffer; the law prefers the right of the owner, who has done a meritorious act by pursuing a felon to condign punishment, to the right of the buyer, whose merit is only negative, that he has been guilty of no unfair transaction. And it is now usual for the court, upon the conviction of a felon, to order, without any writ, immediate restitution of such goods as are brought into court, to be made to the several prosecutors. Or else, secondly, without such writ of restitution, the party may peaceably retake his goods, wherever he happens to find them, unless a new property be fairly acquired therein. Or lastly, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover against him for his goods; and recover a satisfaction in damages. But such action lies not before prosecution; for so felonies would be made up and healed: and also reception is unlawful, if it be done with intention to smother and compound the larciny; it then becoming the heinous offence of *theft-bote*.

It is not uncommon, when a person is convicted of

Convoca-
tion
|

sion.

Convulsa-
lus.

a misdemeanour, which principally and more immediately affects some individual, as a battery, imprisonment, or the like, for the court to permit the defendant to *speak with the prosecutor*, before any judgement is pronounced; and if the prosecutor declares himself satisfied, to inflict but a trivial punishment. This is done to reimburse the prosecutor his expences, and make him some private amends, without the trouble and circuity of a civil action. But it is surely a dangerous practice: and, though it may be entrusted to the prudence and discretion of the judges in the superior courts of record, it ought never to be allowed in local or inferior jurisdictions, such as the quarter-sessions; where prosecutions for assaults are by this means too frequently commenced, rather for private lucre, than for the great ends of public justice. Above all, it should never be suffered, where the testimony of the prosecutor himself is necessary to convict the defendant: for by this means the rules of evidence are entirely subverted; the prosecutor becomes in effect a plaintiff, and yet is suffered to bear witness for himself. May even a voluntary forgiveness by the party injured, ought not, in true policy, to intercept the stroke of justice. "This, says an elegant writer, (who pleads with equal strength for the *certainty*, as for the lenity of punishment) may be an act of good nature and humanity, but it is contrary to the good of the public. For, although a private citizen may dispense with satisfaction for his private injury, he cannot remove the necessity of public example. The right of punishing belongs not to any one individual in particular, but to the society in general, or to the sovereign who represents that society; and a man may renounce his own portion of this right, but he cannot give up that of others."

CONVOCATION, an assembly of the clergy of England, by their representatives, to consult of ecclesiastical matters. It is held during the session of parliament, and consists of an upper and a lower house. In the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors; consisting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese, in all 143 divines; viz. 22 deans, 53 archdeacons, 24 prebendaries, and 44 proctors of the diocesan clergy. The lower house chuses its prolocutor; whose business it is to take care that the members attend, to collect their debates and votes, and to carry their resolutions to the upper house. The convocation is summoned by the king's writ, directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, &c.

The power of the convocation is limited by a statute of Henry VIII. They are not to make any canons or ecclesiastical laws, without the king's licence; nor, when permitted to make any, can they put them in execution, but under several restrictions. They have the examining and censuring all heretical and schismatical books and persons, &c.: but there lies an appeal to the king in chancery, or to his delegates. The clergy in convocation, and their servants, have the same privileges as members of parliament.

CONVOLUTION, a winding motion, proper to the trunks of some plants, as the convolvulus, or bind-

weed; the clasps of vines, bryony, &c.

CONVOLVULUS, BIND-WEED, a genus of the pentandria order belonging to the monogynia class of plants. Of this there are 43 species, the most remarkable of which are the following.

1. The *scilium*, or large white bind-weed, is often a troublesome weed in gardens, when its roots are interwoven with those of trees and shrubs, or under hedges, as every small piece of root is apt to grow. It flourishes under moist hedges, and hath white or purplish blossoms. 2. The *scammonia*, or Syrian bind-weed, grows naturally in Syria. The roots are thick, run deep into the ground, and are covered with a dark bark. The branches extend on every side to the distance of 10 or 12 feet; they are slender, and trail on the ground, and are garnished with narrow, arrow-pointed leaves. The flowers are of a pale yellow, and come out from the side of the branches, two fitting upon each long foot-stalk; these are succeeded by roundish seed-vessels, having three cells filled with seeds. 3. The *purpureus*, or convolvulus major, is an annual plant growing naturally in Asia and America, but has been long cultivated in the British gardens. If these plants are properly supported they will rise 10 or 12 feet high in warm summers. There are three or four lasting varieties: the most common hath a purple flower; the others have a white, a red, or a whitish-blue flower, which last hath white seeds. They flower in June, July, and August, and their seeds ripen in autumn. 4. The *nil*, or blue bind-weed, rises with a twining stalk 8 or 10 feet high, garnished with heart-shaped leaves, divided into three lobes, which end in sharp points. These are woolly, and stand upon long foot-stalks. The flowers also come out on long foot-stalks, each sustaining two flowers of a very deep blue colour, whence their name of *anil* or *indigo*. This is one of the most beautiful plants of the genus: it flowers all the latter part of the summer; and in good seasons the seeds ripen very well in the open air. 5. The *battatas*, or Spanish potatoes, hath esculent roots, which are annually imported from Spain and Portugal, where they are greatly cultivated for the table; but they are too tender to thrive in the open air in Britain. Their roots are like the common potato, but require much more room: for they send out many trailing stalks, which extend six or eight feet every way; and at their joints send out roots which in warm countries grow to be very large bulbs; so that from a single root planted, 40 or 50 large potatoes are produced. 6. The *canariensis*, with soft woolly leaves, is a native of the Canaries; but hath long been preserved in the British gardens. It hath a strong fibrous root, from whence arise several twining woody stalks, from, where they have support, will grow more than 20 feet high, garnished with oblong heart-shaped leaves, which are soft and hairy. The flowers are produced from the wings of the leaves, several standing upon one footstalk. They are for the most part of a pale blue; but there is a variety with white flowers. They appear in June, July, and August, and sometimes ripen seeds here. 7. The *tricolor*, or convolvulus minor, is a native of Portugal; but hath long been cultivated in the gardens of this country. It is an annual plant, which hath several thick herbaceous

convolv-
lus.

herbaceous stalks growing about two feet long, which do not twine like the other forts, but decline toward the ground, upon which many of the lower branches lie prostrate; they are garnished with spear-shaped leaves, which fit close to the branches: the footstalks of the flowers come out just above the leaves of the same joint, and at the same side of the stalks. They are about two inches long, each sustaining one large open bell-shaped flower, which in some is of a fine blue colour with a white bottom; in others they are pure white, and some are beautifully variegated with both colours. The white flowers are succeeded by white seeds, and the blue by dark-coloured seeds; which difference is pretty constant. 8. The foldanella, or sea-bindweed, styled also *brassica marina*, grows naturally on the sea-beaches in many parts of England, but cannot be long preserved in gardens. It hath many small white stringy roots, which spread wide and send out several weak trailing branches. These twine about the neighbouring plants like those of the common bindweed, garnished with kidney-shaped leaves like those of the lesser celandine. The flowers are produced on the side of the branches at each joint. They are of a reddish purple colour, and appear in July. They are succeeded by round capsules, having three cells, each containing one black seed. 9. The turpethum is a native of the island of Ceylon. This hath fleshy thick roots, which spread far in the ground, and abound with a milky juice that flows out when the roots are broken or wounded, and soon hardens into a resinous substance when exposed to the sun and air. From the root shoots forth many twining branches, which twist about each other, or the neighbouring plants, like the common bindweed. They are garnished with heart-shaped leaves that are soft to the touch, like those of the marshmallow. The flowers are produced at the joints on the side of the stalks, several standing together on the same footstalk: they are white, and shaped like those of the common great bindweed, and are succeeded by round capsules, having three cells containing two seeds each. 10. The jalapa, or jalap, used in medicine, is a native of Haleppo in Spanish America, situated between La Vera Cruz and Mexico. It hath a large root of an oval form, which is full of a milky juice; from which come out many herbaceous twining stalks rising eight or ten feet high, garnished with variable leaves; some of them being heart-shaped, others angular, and some oblong and pointed. They are smooth, and stand upon long footstalks: the flowers are shaped like those of the common greater bindweed, each footstalk supporting only one flower.

Culture. The first and second sorts are propagated by seeds, which must be sown on a border of light earth. The second sort must have some tall stakes placed near them for their branches to twine about, otherwise they will spread on the ground and make a bad appearance. The third sort is annual, and must be propagated by seeds sown on a hot-bed in the spring, and towards the end of May they should be planted out in warm borders, and treated in the same manner with the former. The fourth species is sometimes propagated in this country. The roots must be planted on a hot-bed in the spring; and if the plants are covered in bad weather with glasses, they will

Vol. III.

produce flowers and some small bulbs from the joints of the stalks: but if they are exposed to the open air they seldom grow to any size. The fifth is propagated by laying down the young shoots in the spring, which generally put out roots in three or four months: they may then be taken from the old plants, and each placed in a separate pot, which is to be set in the shade till they have taken new root; after which they may be placed with other hardy green-house plants till autumn, when they should be removed into the green-house, and afterwards treated in the same manner as myrtles and other green-house plants. The turbith and jalap are too tender to live in this country, unless they are constantly kept in a stove. The other species require no particular directions for their cultivation.

Uses. The root of the first sort is a very acrid purgative to the human race, but is eaten by hogs in large quantities without any detriment. The inspissated juice of this might probably answer the purposes of scammony, which at present is imported from Aleppo at a considerable annual expence. The inspissated juice of the second species is used in medicine as an acrid purgative; as are also the roots of JALAP and TURPETH. The foldanella has likewise been used with the same intention. Half an ounce of the juice, or a drachm of the powder, is an acrid purge. The leaves applied externally are said to diminish dropsical swellings of the feet.

CONVOY, in naval affairs, one or more ships of war, employed to accompany and protect merchant-ships, and prevent their being insulted by pirates, or the enemies of the state in time of war.

CONVOY, in military matters, a body of men that guard any supply of men, money, ammunition, or provisions, conveyed by land into a town, army, or the like, in time of war.

CONUS, a cone, in botany; a species of fruit or scaly seed-vessel, so termed by Tournefort and other botanists. Linnæus has substituted STROBIUS in its place.

CONVULSION, a preternatural and violent contraction of the membranous and muscular parts of the body. See (the *Index* subjoined to) MEDICINE.

CONWAY, a market-town of Carnarvonshire in North Wales, situated near the mouth of a river of the same name, 15 miles west of St Asaph. W. Long. 3. 50. N. Lat. 53. 20.

CONYZA, FLEABANE; a genus of the order of syngenesia, belonging to the polygamia superflua class of plants. There are 19 species, none of which merit any particular description.

CONZA, a town of the kingdom of Naples in Italy, situated on the farther principate, on the river Ofanto, 50 miles south-east of the city of Naples. E. Long. 16. 0. N. L. 41. 0. It is the see of an archbishop.

COOKE (Sir Anthony), descended from Sir Thomas Cooke lord mayor of London, was born in 1506, and supposed to have been educated at Cambridge. He was so eminent for his learning, piety, and prudence, that the guardians of king Edward VI. appointed him to be his chief instructor in learning, and to form his manners. He had four daughters, and being resolved to have sons by education, left he should have

Cook.

Coolers
|
Cooper.

Cooper.

none by birth, he taught his daughters those lessons by night that he had instilled into the prince by day: he was happy in his endeavours, as they proved learned in Greek and Latin, and equally distinguished by virtue, piety, and good fortune. Mildred was married to the great lord Burleigh; Ann to Sir Nicholas Bacon, lord keeper of the great seal; Elizabeth to Sir John Russell, son and heir of Francis earl of Bedford; and Catharine to Sir Henry Killigrew. He lived in exile during the Marian persecution; and returning on the accession of queen Elizabeth, spent the rest of his days in peace and honour, dying in 1576.

COOLERS, in medicine, those remedies which produce an immediate sense of cold, being such as have their parts in less motion than those of the organs of feeling; as fruits, and all acid liquors. Or they are such as by a particular viscosity, or grossness of parts, give the animal fluids a greater consistency than they had before, and consequently retard their motion, having less of that intestine force on which their beat depends: of this sort are cucumbers, and all substances producing viscosity.

COOM, a term applied to the foot that gathers over an oven's mouth; also for that black, greasy substance, which works out of the wheels of carriages.

COOMB, or COMB, of Corn, a dry measure containing 4 bushels, or half a quarter.

COOPER, on board a ship, he that looks to the casks and all other vessels for beer, water, or any other liquor. He hath a mate under him.

COOPER (Anthony-Ahley), first-earl of Shaftesbury, a most able statesman, was the son of Sir John Cooper, bart. of Rockborn in Hampshire, and was born in 1621. He was elected member for Tewkesbury at 19 years of age, in the short parliament that met April 13th 1640. He seems to have been well affected to the king's service at the beginning of the civil wars; for he repaired to the king at Oxford with offers of assistance: but prince Maurice breaking articles to a town in Dorsetshire that he had got to receive him, furnished him with a pretence for going over to the parliament, from which he accepted a commission. When Richard Cromwell was deposed, and the Rump came again into power, they nominated Sir Anthony one of their council of state, and a commissioner for managing the army. At that very time he had engaged in a secret correspondence for restoring Charles II. and, upon the king's coming over, was sworn of his privy council. He was one of the commissioners for the trial of the regicides; was soon after made chancellor of the exchequer, then a commissioner of the treasury; in 1672 was created earl of Shaftesbury; and soon after was raised to the post of lord chancellor. He filled this office with great ability and integrity; and though the short time he was at the helm was in a tempestuous season, it is doing him justice to say, nothing could either distract or affright him. The great seal was taken from him in 1673, 12 months after his receiving it; but, though out of office, he still made a distinguished figure in parliament, for it was not in his nature to remain inactive. He drew upon himself the implacable hatred of the duke of York, by steadily promoting, if not originally inventing, the famous project of an exclusion-bill. When his enemies

came into power, he found it necessary to consult his safety by retiring into Holland, where he died six weeks after his arrival, in 1683. While his great abilities are confessed by all, it has been his misfortune to have his history recorded by his enemies, who studied to render him odious. Butler has given a very severe character of him in his Hudibras.

COOPER (Anthony Ahley), earl of Shaftesbury, was son of Anthony earl of Shaftesbury, and grandson of Anthony first earl of Shaftesbury, lord high chancellor of England. He was born in 1677, at Exeter-house in London, where his grandfather lived, who from the time of his birth conceived so great an affection for him, that he undertook the care of his education; and and he made so good a progress in learning, that he could read with ease both the Latin and Greek languages, when only 11 years old. In 1683, his father carried him to the school at Winchester, where he was often insulted on his grandfather's account, whose memory was odious to the zealots for despotic power: he therefore prevailed with his father to consent to his desire of going abroad. After three years stay abroad, he returned to England, in 1689, and was offered a seat in parliament in some of those boroughs where his family had an interest. But this offer he did not now accept, that he might not be interrupted in the course of his studies, which he prosecuted five years more, with great vigour and success; till, on Sir John Trenchard's death, he was elected burgess for Poole. Soon after his coming into parliament, he had an opportunity given him of expressing that spirit of liberty by which he uniformly directed his conduct on all occasions. It was the bringing in and promoting "the act for regulating trials in cases of high treason." But the fatigues of attending the house of commons, in a few years so impaired his health, that he was obliged to decline coming again into parliament after the dissolution in 1698. He then went to Holland, where the conversation of Mr Bayle, Mr le Clerc, and several other learned and ingenious men, induced him to reside a twelvemonth. Soon after he returned to England he became earl of Shaftesbury. But his own private affairs hindered him from attending the house of lords till the second year of his peerage, when he was very earnest to support king William's measures, who was at that time projecting the grand alliance. So much was he in favour with king William, that he had the offer of secretary of state; but his declining constitution would not allow him to accept it. Though he was disabled from engaging in business, the king consulted him on matters of very high importance; and it is pretty well known that he had the greatest share in composing that celebrated last speech of king William, December 31st 1701. On Queen Anne's accession to the throne, he returned to his retired manner of life, being no longer advised with concerning the public; and was then removed from the vice admiralty of Dorset, which had been in the family for three generations. In 1703, he made a second journey to Holland, and returned to England the year following. The French prophets soon after this, having by their enthusiastic extravagancies made a great noise throughout the nation, and, among different opinions, some advising a prosecution, the lord Shaftesbury apprehended

Cooper.

prehended that such measures tended rather to inflame than to cure the disease, and this occasioned his *letter concerning Enthusiasm*. In 1711, finding his health still declining, he was advised to seek assistance from a warmer climate, and accordingly set out for Naples; where he lived near two years, and died there in 1713. In the three volumes of his characteristics, he completed the whole of his writings which he intended should be made public, though we have several pieces of his published by other hands. His principal study was the writers of antiquity, from which he formed to himself the plan of his philosophy.

COOPER (Samuel), a very eminent English miniature painter, born in 1609, and bred under the care of his uncle John Hoskins. He derived, however, his principal excellence from a study of the works of Van Dyck, in whose time he lived; inasmuch that he was commonly styled "Van Dyck in little." His pencil was chiefly confined to the head, in which, with all its dependences, especially the hair, he was inimitable; but if he descended lower, his incorrectness was notorious. He died in 1672; and his pieces are universally admired all over Europe, selling for incredible prices. —He had a brother, Alexander, likewise a good miniature painter, who became limner to Christina queen of Sweden.

COOPER (Thomas), a pious and learned prelate in the reign of queen Elizabeth, was born at Oxford about the year 1517. He was educated in the school adjoining to Madalene college, of which he was a choirster; where also, in 1539, he was elected probationer, and fellow in the following year. About the year 1546, quitting his fellowship, he applied himself to the study of physic, in 1556 took the degree of bachelor in that faculty, and practised as physician at Oxford. Being inclined to the Protestant religion, probably this was only a prudent suspension of his final intentions, during the Popish reign of queen Mary: for, on the accession of Elizabeth, he resumed the study of divinity; became a celebrated preacher, was made dean of Christchurch and vice-chancellor of the university, having accumulated the degrees of bachelor and doctor in divinity. In 1569 he was made dean of Gloucester; and, the year following, bishop of Lincoln: whence, in 1584, he was translated to the see of Winchester; in which city he died on the 29th of April 1594, and was buried in the cathedral there, on the south side of the choir. The several writers who have mentioned Dr Cooper, unanimously give him the character of an eloquent preacher, a learned divine, and a good man. He had the misfortune while at Oxford to marry a lady whose gallantries became notorious: nevertheless he would not be divorced from her; knowing that he could not live without a wife, he did not chuse "to charge his conscience with the scandal of a second marriage." —He wrote, 1. the Epitome of Chronicles from the 17th year after Christ, to 1540, and thence after to 1560. 2. *Theſaurus linguæ Romanæ et Britannicæ*. This dictionary, which is an improvement upon Elyot's, was much admired by queen Elizabeth, who thence forward determined to promote the author. 3. A brief exposition of such chapters of the Old Testament, as usually are read in the church, at common prayer, on Sundays throughout the year.

4. An admonition to the people of England. 5. Ser. Co-ordinate mons.

CO-ORDINATE, something of equal order, rank or degree with another.

COOT, in ornithology. See FULICA.

COOTWICH (John), doctor of laws, was born at Utrecht, and spent great part of his life in travelling. He published in Latin, in 1619, and account of his journey from Jerusalem, and from Syria; which is very scarce and in high esteem. Time of his death uncertain.

COPAIBA, or *Balsam of COPAIBA*, a liquid resinous juice, flowing from incisions made in the trunk of the fera, a large tree which grows in the Spanish West Indies; and is used as a corroborating and detergent medicine.

COPAL, improperly called *gum copal*, is a gum of the resinous kind brought from New Spain. It is the concrete juice of a tree which grows in these parts; and comes to us in irregular masses, some of which are transparent, and of different shades as to colour, from a light yellow to a deep brown. Some pieces are whitish and semi-transparent. To the smell it is more agreeable than frankincense; but hath neither the solubility in water common to gums, nor in spirit of wine common to resins, at least in any considerable degree. By these properties it resembles amber; which has induced some to think it a mineral bitumen resembling that substance. In distillation it yields an oil, which like mineral petrolea is indissoluble in spirit of wine. Copal itself is soluble in the essential oils, particularly in that of lavender, but not easily in the expressed ones. It may, however, be dissolved in linseed oil by digestion, with a heat very little less than is sufficient to boil or decompose the oil. This solution, diluted with spirit of turpentine, forms a beautiful transparent varnish, which when properly applied, and slowly dried, is very hard and durable. This varnish is applied to snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings, and greatly restores the decayed colours of old pictures, by filling up the cracks and rendering the surfaces capable of reflecting light more uniformly.

COPE, an ecclesiastical ornament, usually worn by chanters, and sub-chanters, when they officiate in solemnity. It reaches from the shoulders to the feet. The ancients called it *pluviale*. —The word is also used for the roof or covering of a house, &c.

COPE is also the name of an ancient custom or tribute due to the king, or lord of the soil, out of the lead-mines in some part of Derbyshire; of which Manlove saith thus:

Egrefs and regrefs to the king's highway,
The miners have; and *lot* and *cope* they pay:
The thirteenth dish of ore within their mine,
To the lord, for *lot*, they pay at measuring time;
Sixpence a load for *cope* the lord demands,
And that is paid to the *burghmaster*'s hands.

This word by domesday-book, as Mr Hager hath interpreted it, signifies a hill: and *cope* is taken for the supreme cover, as the *cope of heaven*.

COPENHAGEN, the capital of the kingdom of Denmark, situated on the eastern shore of the island of Zealand, upon a fine bay of the Baltic sea, not far

Co-ordinate
Copen-
ha-
gen.

Copenha- from the strait called the Sound : E. Long. 13. 0.
gen. Lat. 55. 30.

Copernican. This city is neither very large nor very ancient. The precise date of its foundation is disputed; but the most probable account is, that it took its rise from a castle built on the spot in the year 1168, by archbishop Wide, as a protection against the pirates which at that time swarmed in the Baltic. The convenience of the situation, and the security afforded by the castle, soon induced a number of the inhabitants of Zealand to resort thither; so that at length it became a fine city, and the capital of the kingdom. According to Molelt-worth, it approaches nearly to the size of Bristol. The walls in his time inclosed a great deal more ground than was occupied by the houses; but as in his time they were daily increasing, it is probable that now the vacant space is in a great measure filled up. Its advantageous situation for trade, and the excellency of its harbour, are not to be surpassed; and were Copenhagen a free port, there is no doubt but it would soon become the emporium of the commerce into the Baltic. The harbour is surrounded by the fortifications of the town; and the entrance is so narrow, that only one ship can enter at a time. In the night-time this entrance is shut up by a strong boom laid across. The passage is defended on the one side by the cannon of the citadel, and on the other by a strong block-house, well mounted with heavy artillery. The whole haven is capable of containing 500 sail of large ships. It is inclosed by a wooden gallery, close to which every ship has her appointed station; a circumstance that adds greatly to the beauty and convenience of the scene, than which nothing can be more rich and regular, when a number of shipping happen to lie in the port. The city is strong both by nature and art; the situation being marshy, deep canals cut all round, and the fortifications executed agreeable to the best modern improvements; but the works are chiefly composed of turf and earth. Experience has shewn its strength; it having sustained two remarkable sieges against a fine Swedish army, flushed with victory, and headed by the most magnanimous princes of the age. It is probable, indeed, from these instances, that an enemy may carry on their approaches more easily in winter than in summer, the dykes being then covered over with ice, upon which the Swedish army marched. Its security, however, in this particular, consists in the impossibility of an army's keeping the field long amidst the rigorous winters of all northern climates. The buildings of the town are in general mean and deplorable: even the king's palace is surpassed by the houses of private gentlemen in other countries. There are, however, a few good buildings, as the change, arsenal, and observatory, erected by order of that excellent prince Christian IV. to whom almost all the decorations of Copenhagen are owing. What adds greatly to the convenience of the city is the neighbourhood of the little island of *Finack*, or rather *Amack*, joined to it by a bridge. From this place the markets of the city are supplied with fowl, beef, mutton, venison, corn, and culinary vegetables, which are produced here in the greatest abundance.

COPERNICAN, in general, something belonging to Copernicus. Hence,

COPERNICAN System or Hypothesis, that system of Copernicus the world, wherein the sun is supposed to rest in the centre, and the planets, with the earth, to move in ellipses round him. See COPERNICUS.

COPERNICUS (Nicolaus), an eminent astronomer, was born at Thorn in Prussia, in the year 1472. He was taught the Latin and Greek languages at home; and afterwards sent to Cracovia, where he studied philosophy and physics. His genius in the mean time was naturally turned to mathematics, which he pursued through all its various branches. He set out for Italy when he was 23 years of age; but staid at Bonaonia some time, for the sake of being with the celebrated astronomer of that place, Dominicus Maria; whose conversation, however, and company, he affected, not so much as a learner, as an assistant to him in making his observations. From thence he passed to Rome, where he was no sooner arrived than he was considered as not inferior to the famous Regiomontanus; and acquired in short so great a reputation, that he was chosen professor of mathematics, which he taught for a long time with great applause. He also made some astronomical observations there about the year 1500. Returning to his own country some years after, he began to apply his vast knowledge in mathematics to correct the system of astronomy which then prevailed. He set himself to collect all the books which had been written by philosophers and astronomers, and to examine all the various hypotheses they had invented for the solution of the celestial phenomena; to try if a more symmetrical order and constitution of the parts of the world could not be discovered, and a more just and exquisite harmony in its motions established, than what the astronomers of those times so easily admitted. But of all their hypotheses none pleased him so well as the Pythagorean, which made the sun to be the centre of the system, and supposed the earth to move not only round the sun, but round its own axis also. He thought he discerned much beautiful order and proportion in this; and that all that embarrassment and perplexity from epicycles and excentrics, which attended the Ptolemaic hypothesis, would here be entirely removed.

This system, then, he began to consider, and to write upon, when he was about 35 years of age. He employed himself in contemplating the phenomena carefully; in making mathematical calculations; in examining the observations of the ancients, and in making new ones of his own; and after more than 20 years chiefly spent in this manner, he brought his scheme to perfection, and established that system of the world which goes by his name, and is now universally received, (see ASTRONOMY, n° 74.) His system, however, was then looked upon as a most dangerous heresy: for which he was thrown into prison by Pope Urban VIII. and not suffered to come out till he had recanted his opinion; that is, till he had renounced the testimony of his senses. He died the 24th of May 1553, in the 70th year of his age.

This extraordinary man had been made canon of Worms by his mother's brother, Lucas Wazelerodius, who was bishop of that place. He was not only the greatest of astronomers, but a perfect master of the Greek and Latin tongues; to all which he joined the greatest

Copernicus
Copy.

greatest piety and innocence of manners.

COPERNICUS, the name of an astronomical instrument, invented by Mr Whiston, to exhibit the motion and phenomena of the planets, both primary and secondary. It is built upon the Copernican system, and for that reason called by his name.

COPHTS, COPHITI, or COPTS, a name given to such of the Christians of Egypt as are of the sect of Jacobites.

The Cophits have a patriarch, who is styled the patriarch of Alexandria, having 11 or 12 bishops under him, but no archbishop. The rest of the clergy, whether secular or regular, are of the order of St Anthony, St Paul, and St Macarius, each of whom have their monasteries. The Cophits have seven sacraments, *viz.* baptism, the eucharist, confirmation, ordination, faith, fasting and prayer.

COPHTIC or COPTIC *Language*, is that spoken by the Cophits, being the ancient language of the Egyptians, intermixed with the Greek, and the characters of it being those of the Greek.

The ancient Coptic is now a dead language, to be met with no where but in books, and those only translations of the scriptures, and of ecclesiastical offices, or others that have a relation thereto; the language now used over all the country being that of the Arabic.

COPPER constitutes a distinct genus of metals, being next to iron in specific gravity, but lighter than gold, silver, or lead. See CHEMISTRY, n^o 141, 200, 241, 278, 332, 370.

Fulminating COPPER. See CHEMISTRY, n^o 333.
Poison of COPPER. See POISON.

COPPERAS, a name given to the factitious green vitriol. See CHEMISTRY, n^o 110.

COPPICE, or COPSE, a little wood, consisting of under-woods, or such as may be raised either by sowing or planting.

COPULATION, the act of generation, or the congress of the male and female, otherwise called *cottion*. See GENERATION.

COPY, in a law sense, a transcript of a writing or instrument, made for the use and satisfaction of some of the parties concerned, or in order to preserve the memory thereof.

COPY is also used for an imitation of any original work; particularly a painting, draught, figure, &c.

COPY, among printers, denotes the manuscript or original of a book given to print from.

COPY-HOLD, a tenure for which a tenant has nothing to show but the copy of the rolls made by the steward of the lord's court.

It is called a base tenure; because the tenant holds the land at the will of the lord. However, it is not simply at the will of the lord, but according to the custom of the manor by which such estate is descendible, and the tenants heirs may inherit it; and a copy-holder, so long as he does his services, and does not break the custom, cannot be ejected by the lord; and if he be, he shall have trespass against him.

COPY-HOLDER, one who is admitted tenant of lands or tenements within a manor, which time out of mind, by use and custom of the manor, have been demisable, and demised to such as will take them in fee-simple or fee-tail, for life, years, or at will, according to the

Copy.

custom of the manor by copy of court-roll; but is generally where the tenant has such estate either in fee or for three lives.

COPY-Right, the right which an author may be supposed to have in his own original literary compositions; so that no other person, without his leave, may publish or make profit of the copies. When a man by the exertion of his rational powers has produced an original work, he has clearly a right to dispose of that identical work as he pleases; and any attempt to take it from him, or vary the disposition he has made of it, is an invasion of his right of property. Now the identity of a literary composition consists entirely in the *sentiment* and the *language*; the same conceptions, clothed in the same words, must necessarily be the same composition: and whatever method be taken of conveying that composition to the ear, or to the eye of another, by recital, by writing, or by printing, in any number of copies, or at any period of time, it is always the identical work of the author which is so conveyed; and no other man (it hath been thought) can have a right to convey or transfer it without his consent, either tacitly or expressly given. This consent may perhaps be tacitly given when an author permits his work to be published without any reserve of right, and without stamping on it any marks of ownership; it is then a present to the public, like the building of a church, or the laying out a new highway; but in case of a bargain for a single impression, or a total sale or gift of the copy-right; in the one case the reversion hath been thought to continue in the original proprietor; in the other the whole property, with its exclusive rights, to be perpetually transferred to the grantee. On the other hand it is urged, that though the exclusive right of the manuscript, and all which it contains, belongs undoubtedly to the owner, *before* it is printed or published; yet from the instant of publication, the exclusive right of an author or his assigns to the sole communication of his ideas immediately vanishes and evaporates; as being a right of too subtle and unsubstantial a nature to become the subject of property at the common law, and only capable of being guarded by positive statute and special provisions of the magistrate.

The Roman law adjudged, that if one man wrote any thing, though ever so elegantly, on the paper or parchment of another, the writing should belong to the original owner of the materials on which it was written: meaning certainly nothing more thereby than the mere mechanical operation of writing, for which it directed the scribe to receive a satisfaction; especially as, in works of genius and invention, such as a picture painted on another man's canvas, the same law gave the canvas to the painter. We find no other mention in the law of any property in the works of the understanding, though the sale of literary copies, for the purposes of recital or multiplication, is certainly as ancient as the times of Terence, Martial, and Statius. Neither with us in Britain hath there been (till very lately) any final determination upon the right of authors at the common law. It was determined in the case of *Miller v. Taylor* in *B. R. Pasch. 9 Geo. III. 1769*, that an exclusive copy-right in authors subsisted by the common law. But afterwards,

Cogrimbo
Corallina.

wards, in the case of *Donaldson v. Bocket*, before the house of lords, which was finally determined 22^d February 1774, it was held that no copy-right subsists in authors, after the expiration of the several terms created by the statute 8 Ann c. 19. This statute declares, that the author and his assigns shall have the whole liberty of printing and reprinting his works for the term of 14 years, and no longer; and also protects that property by additional penalties and forfeitures; directing farther, that if at the end of that term the author himself be living, the right shall then return to him for another term of the same duration.

COQUIMBO, a port-town of Chili, in South America, situated at the mouth of a river of the same name, which discharges itself into the pacific ocean. W. Long. 75. 10. N. Lat. 30. 0.

COR CAROLI, in astronomy, an extraconstellated star in the northern hemisphere, situated between the *coma berenices*, and *ursa major*; so called by Dr Halley in honour of king Charles.

COR HYDRE, a fixed star of the first magnitude, in the constellation of hydra.

COR LEONIS, or **REGULUS**, in astronomy, a fixed star of the first magnitude, in the constellation Leo.

CORACO-BRACHIALIS, in anatomy, the name of a muscle in the arm, serving to raise it upwards.

CORACOIDES, in anatomy, a small sharp process of the scapula. See **ANATOMY**, n^o 46.

CORACOMANTES, in antiquity, persons who foretold events from their observations on crows.

CORALLINA, or **CORAL**, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radiated, jointed, and calcareous. The species are eight, distinguished by the form of their branches, and are found in the ocean adhering to stones, bones, shells, &c. The corals were formerly believed to be vegetable substances hardened by the air; but are now known to be composed of congeries of animals, which are even endued with the faculty of moving spontaneously.

The islands in the South-sea are mostly coral rocks covered over with earth. The little creatures, which have scarce sensation enough to distinguish them from plants, build up a rocky structure from the bottom of that sea too deep to be measured by human art, till it reaches the surface. Some of these coralline islands appear to be of a much older date than others; particularly the Friendly islands: and it is probable that as these submarine works are continually going on, new islands may by that means frequently be produced.

When coral is newly taken up out of the sea, the small protuberances on its surface are soft, and yield, on being pressed, a milky juice which effervesces with acids. The cortical part with which the coral is all over covered is not near so compact as the internal, and may easily be taken off whilst fresh; and from this part it is usually freed before it comes to the market. The greatest coral trade is in Genoa and Leghorn. The small sprigs unfit for ornamental uses are in the shops levigated into a subtile powder; which, however, has no medicinal virtues superior to the common testacea. Coral is not unfrequently imitated by artificial compositions, some of which are made to resemble it exactly; but the abuse may be discovered

Coral.

by fire, the counterfeit not affording the alkaline earth which is afforded by the genuine coral. The colouring ingredients in the artificial coral are cinabar and minium, both of which are easily discovered. The natural coral seems to receive its colour from iron; for spirit of vitriol acquires from it a ferrugineous taste; and on calcining the coral, some particles are found among the ashes that are attracted by the magnet. Sixteen ounces of coral, according to Neuman, when distilled in an open fire, yield about six scruples and an half of volatile alkaline spirit, with two or three grains of an empyreumatic oil: from the caput mortuum calcined, five scruples and a half of fixed salt may be extracted. In former times, many extraordinary virtues were expected from this substance, on account of its fine red colour; and therefore a great number of methods were tried to extract this colour by means of spirit of wine. None of these, however, succeeded. A red colour was indeed sometimes obtained, but it turned out the same whether any coral was used in the operation or not. In some of these processes, however, the coral loses its colour. One method of making the tincture is by dissolving a pound of sugar in a little water, and then adding half a pound of wax. A pound of coral boiled in this mixture loses its redness, but is found to be unaltered in other respects. In order to prepare the tincture, the wax and sugar must be dissolved in spirit of wine.

CORAL FISHERY. Red coral is found in the Mediterranean, on the shores of Provence, from Cape de la Couronne to that of St Tropez; about the isles of Majorca and Minorca; on the south of Sicily; on the coasts of Africa; and, lastly, in the Ethiopic ocean, about cape Negro. The dyvers says, that the little branches are found only in the caverns whose situation is parallel to the earth's surface, and open to the south. The manner of fishing being nearly the same wherever coral is found, it will suffice to instance the method used at the bastion of France, under the direction of the company established at Marseilles for that fishery. Seven or eight men go in a boat commanded by the patron or proprietor; and when the net is thrown by the cafter, the rest work the vessel, and help to draw the net in. The net is composed of two rafters of wood tied cross-wise, with leads fixed to them: to these they fasten a quantity of hemp twisted loosely round, and intermingled with some large netting. This instrument is let down where they think there is coral, and pulled up again when the coral is strongly intangled in the hemp and netting. For this purpose, six boats are sometimes required; and if in hauling in, the rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to sea, they agree for the price of the coral, which is sometimes more, sometimes less a pound; and they engage, on pain of corporal punishment, that neither they nor their crew shall embezzle any, but deliver the whole to the proprietors. When the fishery is ended, which amounts one year with another to twenty-five quintals for each boat, it is divided into thirteen parts, of which the proprietor hath four, the cafters two, and the other six men one each, the thirteenth belongs to the company for payment of the boat furnished them.

CORALLODENDRON,

Corallo-
dendron
|
Coranich

CORALLODENDRON, in botany. See ERYTHRINA.

CORAM (Captain Thomas), a gentleman remarkably distinguished by his humanity, was born about the year 1668, and spent the early part of his life in the station of master of a vessel trading to our colonies. Afterwards residing in the eastern part of the metropolis, among seafaring people, where business often obliged him to come early into the city and return late, he frequently saw young children exposed in the streets through the indigence or cruelty of their parents. This excited his compassion, and induced him to project the foundation of an hospital for foundlings. In this humane design he laboured with indefatigable diligence for seventeen years; and by his application procured a number of the nobility and gentry to patronize and carry the scheme into execution, and at length obtained the royal charter for it. He was also highly instrumental in promoting the trade of America, by procuring a bounty upon naval stores imported from our colonies. *He was likewise eminently concerned in settling on foot the colonies of Georgia and Nova Scotia. His last charitable design, in which he lived to make some progress, was a scheme for uniting the North American Indians more closely to the British interest, by an establishment for the education of Indian girls. In short, he spent the greatest part of life in labouring for the public, and experienced a fate too common in those who devote their talents to such laudable purposes; being at last indebted for subsistence to the voluntary subscriptions of some public-spirited persons, at the head of whom was the late Frederic Prince of Wales. Captain Coram died in 1751: and was interred, at his own desire, in a vault under the chapel of the Foundling Hospital.

CORAN, or ALCORAN. See ALCORAN.

CORAX, in ornithology, the trivial name of a species of CORVUS.

CORANICH, among the Scotch and Irish, the custom of singing at funerals, anciently prevalent in those countries, and still practised in several parts. Of this custom Mr Pennant gives the following account. "I had not the fortune to be present at any in North Britain; but formerly assisted at one in the south of Ireland, where it was performed in the funerals of horror. The cries are called by the Irish the *ulogohne*, and *hullulu*; two words very expressive of the sound uttered on these occasions; and, being of Celtic stock, etymologists would swear to be the origin of the *υλογαγνη* of the Greeks, and *ululatus* of the Latins. Virgil is very fond of using the last, whenever any of his females are distressed; as are others of the Roman poets, and generally on occasions similar to this. It was my fortune to arrive at a certain town in Kerry at the time that a person of some distinction departed this life: my curiosity led me to the house, where the funeral seemed conducted in the purest classical form.

*Quodcumque aspiceret luctus, gemitusque sonabant,
Formaque non taciti funeris insis erat.*

In short, the *conclamatio* was set up by the friends in the same manner as Virgil describes that consequential of Dido's death;

*Lamentis gemitusque & femineo ululatu
Tecta fremunt.*

Immediately after this followed another ceremony, fully described by Camden in his account of the manners of the ancient Irish; the earnest expostulations and reproaches given to the deceased for quitting this world, where she enjoyed so many blessings, so good a husband, and such fine children. This custom is also of great antiquity, for Eurypylus's mother makes the same address to her dead son.

Tune illa senectæ

*Sera me requies? potuisti relinquere solam
Crudelis?*

But when the time approached for carrying out the corpse, the cry was redoubled,

Tremulis ululatus aethera complent.

a numerous band of females waiting in the outer court to attend the hearle, and to pay in chorus the last tribute of their voices. The habit of this sorrowing train, and the neglect of their persons, were admirably suited to the occasion; their robes were black and flowing, resembling the ancient *Palla*; their feet naked, their hair long and dishevelled: I might truly say,

Ut qui conducti plorant in funera, dicunt

Et faciunt prope plura dolentibus exanimis.

The corpse was carried slowly along the verge of a most beautiful lake, the ululatus was continued, and the whole procession ended among the venerable ruins of an old abbey."

CORBAN, in Jewish antiquity, were those offerings which had life, in opposition to the *minchab*, or those which had not. It is derived from the word *karab*, which signifies "to approach," because the victims were brought to the door of the tabernacle. The corban were always looked upon as the most sacred offerings. The Jews are reproached with defeating, by means of the corban, the precept of the fifth commandment, which enjoins the respect due to parents. For, when a child had no mind to relieve the wants of his father or mother, he would say to them, *It is a gift* (corban) *by whatsoever thou mightest be profited by me, i. e. I have devoted that to God, which you ask of me, and it is no longer mine to give.*

CORBAN is also a ceremony which the Mahometans perform at the foot of mount Ararat, in Arabia, near Mecca. It consists in killing a great number of sheep, and distributing them among the poor.

CORBEILS, in fortification. See BASKET.

CORBEL, in architecture, a representation of a basket, sometimes seen on the heads of the caryatides.

CORBET (Richard), bishop of Norwich, and an eminent poet, was born at Ewell in Surry, toward the latter end of the 16th century; and educated at Oxford, where he was esteemed one of the most celebrated wits of the university. Entering into holy orders, he became a popular preacher, and was made chaplain to king James I.: when, after several preferments in the church, he was, in 1629, made bishop of Oxford; and, in 1632, was translated to the see of Norwich. He was very hospitable, and always a generous encourager of public designs. He died in 1635. There have been several editions of his poems published under the title of *Poemata Stromata*.

CORBET, a town of Picardy in France, with a famous abbey of Benedictine monks. It is seated on the river

Coranich
|
Corbet.

rivar Somme, 10 miles east of Amiens, and 75 north of Paris. E. Long. 2. 35. N. Lat. 49. 55.

CORCELET, in natural history, that part of the fly-clas, which is analogous in its situation to the breast in other animals. Many have called it the breast in these also, but improperly; because the breast of other animals is the place of the lungs and trachea, but these organs are in the fly-clas distributed through the whole body. The wings are affixed to this part of the fly-clas; and there are some distinctions of great consequence in regard to the arrangement and distribution of those animals into genera. Some flies have a double corcelet, or one divided into two parts; and this is the case of the fly produced from the fornica leo, which therefore does not carry its only distinction in the figure of its antennæ. One pair of the legs of this fly are attached to the first or anterior corcelet, which is also capable of moving on the other.

The corcelets of some flies are also much more elevated than those of others; and in some this elevation is carried so far, that the head is forced by it to be bent downward, and the creature is plainly made hump-backed by it. The great kind, and the *tipula*, furnish instances of this elevated and hump-backed corcelet.

A series of flies of two wings are known by a very particular armament which they carry on the corcelet, usually called their *breast*. This consists of two long, slender, sharp-pointed prickles, which are immovable in their insertions, and seem meant as offensive or defensive weapons; but in what manner they are used is not easily to be determined.

All these flies are produced from long water-worms with open and funnel-fashioned tails, or furnished with their aperture for respiration at the hinder extremity. These tails are bordered with hairs, which the creature makes to diverge from their insertion, and form a kind of funnel at the surface of the water, when it throws up its tail for air.

There are three known species of this sort of fly, with armed corcelets, which differ much in size, but are all produced of worms of this kind. The largest of these flies is produced from the largest and longest worm, and are something longer than the bee. The smallest are produced of worms very small and slender, and are themselves extremely minute: and the third kind is of a middle size between these, and produced from a proportionably smaller worm than that of the first, and proportionably larger than that of the second species.

All these species have their wings but little distinguishable at their first production from the shell; they appear indeed only like two slender filaments laid across their bodies: but they quickly flew that in this state they were only very nicely folded together; and soon expanded, and flew their full extent and proportion.

When first produced from the shell, these flies are of a pale green colour. The under part of their belly in many continues green, but in the greater number it becomes of a pale dead brown. Some of them have the outside of their bodies of a deep brown, approaching to black, with lines of a dead brown between the commissures of the rings. The back of some others has only a blackish brown band, which runs straight

down from the corcelet to the end of the body, the whole body beside being of a dead brown. The corcelet in these flies is brown, and the prickles are yellowish near their insertions, but nearly black at their points. They have three of the final glossy eyes disposed in the shape of a triangle on the back part of their head; and their reticular eyes are brown, and at some distance from one another.

CORCULUM, a diminutive from *cor* "the heart," little heart; the essence of a seed, and principle of life of the future plant, attached to and contained within the lobes. It consists of two parts, termed by Linnaeus *PLUMULA* and *ROSTELLUM*. The former is the *radicula* of Grew and other naturalists. The corculum is in fact the embryo of the future vegetable; and is attached by two trunks of vessels to the lobes at their union. The first of its two parts mounts upward, and becomes the trunk. The other strikes into the ground, and is the rudiment of the root. The lobes and heart of the seed are distinctly visible in the bean, and other seeds of that class, especially after remaining some time in water or earth. See *COTYLEDON*, *GERMINATION*, and *VEGETATION*.

The principle of life is seated either at the summit or base of the feed. From this circumstance are constructed the two first classes in Cæsalpinus's method, containing trees and shrubs only.

CORD, or **CHORD**, an assemblage of several threads of hemp, cabled or twisted together by means of a wheel. See *CORDAGE*. The word comes from the Greek *χορδή*, which properly signifies an intestine or gut, of which cords may be made. See *CHORD*.

Magical CORD, an instrument in great use among the Laplanders, and by them supposed to be endued with a number of virtues. It is a cord or rope with three knots tied in it. They use many magical rites and ceremonies in the tying of this cord; and, when thus prepared, it is supposed to have power over the winds; and they will sell, by means of it, a good wind, or at least the promise of one, to a ship. If they untie only one of these knots, a moderate gale succeeds; if two, it is much stronger; and if three, a storm is sure to follow.

CORD of Wood, a certain quantity of wood for burning, so called because formerly measured with a cord. The dimensions of a statute cord of wood are eight feet long, four feet high, and four feet broad.

CORD-WOOD, is new wood, and such as, when brought by water, comes on board a vessel, in opposition to that which is floated.

CORDAGE, a term used in general for all sorts of cord, whether small, middling, or great. See *ROPE*.

The naval cordage of the earlier ages was in all probability only thongs of leather. These primitive ropes were retained by the Caledonians in the third century. The nations to the north of the Baltic had them in the ninth, or tenth centuries. And the inhabitants of the western isles of Scotland make use of them at present: cutting the skin of a seal, or the raw and salted hide of a cow into long pieces, and fastening the plough to their horses with them, or even twisting them into strong ropes of 20 or 30 fathoms length. But these, in the south of our island, and on the continent, were early superseded by the use of iron-chains.

The

Cordage
|
Cordial.

The very maritime and commercial nation of the Veneti, that was so intimately connected with the Belge of Britain, used iron chains for their cables in the days of Cæsar. But in the more distant and refined countries of the south, both thongs and these had long given place to the use of vegetable threads, and the arts of combining them into strength. In this manner the Greeks appear to have used the common rushes of their country, and the Carthaginians the *spartum*, or broom of Spain. And as all the cordage of the Romans was made of these materials, at their last descent on our island, to the art of manufacturing them would necessarily be introduced with the Roman settlements among the Britons. Under the direction of Roman artists their thongs of leather would naturally be laid aside, and the junci, or rushes of the plains, worked up into cordage. And what remarkably coincides with this opinion is, that the remains of old cables and ropes are still distinguished among the British sailors by the name of *old junk*.

The nations of Roman Britain, and the tribes of Caledonia and Ireland, had inherited, from their earliest ancestors, many of the ruder arts of navigation. Their ships were large open boats, framed of light timbers ribbed with hurdles, and lined with hides. These were furnished with masts and sails. The latter were formed of hides, as the tackle was of thongs. They were actually of hides among the Veneti as late as the days of Cæsar. And they were never furled, but only bound to the mast. But these slight sea-boats, and their rude furniture, would soon be dismissed by the provincials for the more substantial vessels and more artificial sails of the Romans. The Roman sails, which were composed of flax in the days of Agricola, were afterwards made of hemp; and our own are therefore denominated *cannabis*, or *cannasi*, by our mariners at present. And about the same period assuredly did the junk of the British cordage give way to the same materials; the use of hempen ropes upon land, and of hempen nets for hunting, being very common among the Romans in the first century.

CORDATED, an appellation frequently given by naturalists to things somewhat resembling a heart.

CORDED, in heraldry. A cross corded, some authors take for a cross wound or wrenched about with cords; others, with more probability, take it for a cross made of two pieces of cord.

CORDELERAS, mountains of South America, otherwise called ANDES.

CORDELIER, in church-history, a Franciscan, or religious of the order of St Francis.

CORDEMOI (Géral de), a learned philosopher and historian, born at Paris, made himself known to M. Bossuet, who placed him about the dauphin in the quality of reader. He instructed that young prince with great assiduity; and in 1675 was received into the French academy. He wrote a general history of France during the first races of the French kings, in 2 vols.; and six Discourses on the Distinction between Body and Soul, which were printed together in 1702, in quarto. He died in 1684. M. Cordemoi followed the principles of Descartes.

CORDIAL, in medicine, whatever raises the spirits, and gives them a sudden strength and cheerfulness; as

Vol. III

wine, spirits, the effluvia of flowers, fruit, and many other substances.

CORDON, in fortification, a row of stones, made round on the outside, and set between the wall of the fortrefs which lies aloope, and the parapet which stands perpendicular, after such a manner, that this difference may not be offensive to the eye; whence the cordons serve only as an ornament, ranging round about the place, being only used in fortification of stone-work. For in those made with earth, the void space is filled up with pointed stakes.

CORDOUA, or CORDOVA, a city of Andalusia in Spain, situated on the river Guadalquivir, in a very extensive plain. The circumference is large; but it is not peopled in proportion to its extent, for there are a great many orchards and gardens within the walls. There are many superb structures, palaces, churches, and religious houses; particularly the cathedral, which is very magnificent: it was formerly a mosque when the Moors possessed the town; for which reason it still retains the name of *Mezquita*, which has the same meaning. The square called the Plaza Major is surrounded with very fine houses, under which are piazzas. The trade is flourishing on account of the river; and consists of wine, silk, and Cordovan leather. In the neighbourhood of this place are a vast number of orange and lemon trees, which renders their fruits exceeding cheap. The best horses in Spain come from hence. W. Long. 3. 47. N. Lat. 37. 42.

NEW CORDUA, a considerable town of South America, in the province of Tucuman, with a bishop's see, 175 miles from St Jago. W. Long. 62. 5. S. Lat. 32. 10.

CORDUAN, a famous pharos or light-house of France, in Guienne, at the mouth of the river Gironde. The architecture is extremely fine; and is placed there to hinder vessels from running on the sand-banks at the mouth of the river. W. Long. 1. 9. N. Lat. 45. 36.

CORDUS (Valerius), a learned botanist, was the son of Eriicus Cordus, a physician and poet of Germany. Having learnt the languages, he applied himself to the study of botany: in the prosecution of which, he examined the mountains of Germany, and travelled into Italy; but, being wounded in the leg by the kick of a horse, died at Rome in 1544. He wrote Remarks on Dioscorides, and other works.

CORDWAINERS, or CORDINERS, the term whereby the statutes denominate *shoemakers*. The word is formed from the French *cordonnier*, which Menage derives from *cordonan*, a kind of leather brought from Cordous, whereof they formerly made the upper-leathers of their shoes. Others derive it from *corde*, "rope," because anciently shoes were made of cords; as they still are in some parts of Spain, under the name of *alpargates*. But the former etymology is better warranted: for, in effect, the French workmen who prepare the cordus are still called *cordonniers*.

In Paris they have two pious societies under the titles of *freres cordonniers*, "brothers shoemakers," established by authority towards the middle of the 17th century; the one under the protection of St Crispin, the other of St Crispianus, two saints who had formerly honoured the profession. They live in community,

Cordon
|
Cordwain-
ers.

Corea
|
Corelli.

and under fixed statutes and officers; by which they are directed both in their spiritual and secular concerns. The produce of their shoes goes into a common stock, to furnish necessaries for their support; the rest to be distributed among the poor.

COREA, a peninsula lying to the north-east of China, between 99 and 109 degrees of E. Long. and between 32 and 46 of N. Lat. It is divided into 8 provinces, which contain 40 cities of the 1st rank, 51 of the 2^d, and 70 of the 3^d. The capital of the whole is Hanching, where the king resides. The Jesuits say, the people are well-made, of a sweet and tractable disposition, and fond of learning, music, and dancing, and in general resemble the Chinese. Their houses are mean, being covered with thatch; and they have no beds, but lie on the floor. They have little silk, and therefore make use of linen-cloth in its room. Their arms are cross-bows, and very long sabres or swords. Their trade consists in white paper, pencils, gingfeng, gold, silver, iron, yellow varnish, fowls whose tails are three feet long, horses no more than three feet in height, sable-skins, castor, and mineral salt. In general it is a fertile country, though abounding in mountains. They never bury their dead till three years after their decease, but keep them close shut up in coffins for that time. It is tributary to China.

COREIA, in antiquity, a festival in honour of Proserpine.

CORELLI (Arcangelo), the famous Italian musician and composer, a native of Fusignano, in the territory of Bologna, was born in 1653. He entertained an early propensity to the violin; and, as he advanced in years, laboured incessantly in the practice of that instrument. About the year 1672, his curiosity led him to visit Paris, probably with a view to attend the improvements which were making in music under the influence of cardinal Mazarine, and in consequence of the establishment of a royal academy; but, notwithstanding the character which he brought with him, he was driven back to Rome by Lully, whose jealous temper could not brook so formidable a rival as this illustrious Italian. In the year 1680 he visited Germany, and met with a reception suitable to his merit from most of the German princes, particularly the elector of Bavaria; in whose service he was retained, and continued for some time. After about five years stay abroad, he returned again to Rome, and there pursued his studies with great assiduity.

The proficiency of Corelli on his favourite instrument the violin was so great, that the fame of it reached throughout Europe. The style of his performance was learned, elegant, and pathetic; and his tone firm and even. Mr Geminiani, who was well acquainted with, and had studied it, was used to resemble it to a sweet trumpet. A person who had heard him perform says, that, whilst he was playing on the violin, it was usual for his countenance to be distorted, his eyes to become as red as fire, and his eye-balls to roll as in an agony.

Corelli was highly favoured by that great patron of poetry and music, cardinal Ottoboni. Crescembini says, that he regulated the musical academy held at the palace of his eminence every Monday afternoon.

Corelli.

Here it was that Mr Handel became acquainted with him; and in this academy a serenata of Mr Handel, intitled, *Il Triosfo del Tempo*, was performed, the overture to which was in a style so new and singular, that Corelli was confounded in his first attempt to play it.

During the residence of Corelli at Rome, besides those of his own country, many persons were ambitious of becoming his disciples, and learning the practice on the violin from the greatest master of that instrument the world had then heard of. Of these it is said the late lord Edgecumbe was one; and that the fine mezzotinto print of Corelli by Smith, was scraped from a picture painted by Mr Hugh Howard at Rome for that nobleman.

Corelli died at Rome in 1713; and was buried in the church of the Rotunda, otherwise called the Pantheon, in the first chapel, on the left hand of the entrance. Over the place of his interment is a sepulchral monument to his honour, with a marble bust thereon, erected at the expence of Philip-William, count palatine of the Rhine, under the care and direction of cardinal Ottoboni.

For many years after his decease, this excellent musician was commemorated by a solemn musical performance in the Pantheon, on the anniversary of his death. In the year 1730 an eminent master, now living, was present at that solemnity, who relates that at it the third and eighth of his concertos were performed by a numerous band, among whom were many who had been the pupils of the author. He adds, that these two pieces were performed in a slow, distinct, and firm manner, without graces, and just as they are wrote; and from hence concludes, that this was the manner in which they were played by the author himself.

He died possessed of about 6000 l. sterling. He was a passionate admirer of pictures, and lived in an uninterrupted friendship with Carlo Cignani and Carlo Marat: these two eminent painters were rivals for his favour; and for a series of years presented him at times with pictures, as well of other masters as of their own painting. The consequence was, that Corelli became possessed of a large and valuable collection of original paintings; all which, together with the sum above-mentioned, he bequeathed to his dear friend and patron cardinal Ottoboni, who, reserving the pictures to himself, generously distributed the rest of the effects among the relations of the testator.

Corelli is said to have been remarkable for the mildness of his temper and the modesty of his deportment: nevertheless he was not insensible of the respect due to his skill and exquisite performance. Ciber, in the Apology for his Life, p. 340. relates, that when he was playing a solo at cardinal Ottoboni's, he discovered the cardinal and another person engaged in discourse, upon which he laid down his instrument, and being asked the reason, gave for answer, that he feared the music interrupted their conversation.

The compositions of Corelli are celebrated for the harmony resulting from the union of all the parts; but the fineness of the airs is another distinguishing characteristic of them: the allemand in the 10th solo is as remarkable for spirit and force, as that in the

Coreopsis
|
Corfu.

11th is for its enchanting delicacy: his jigs are in a style peculiarly his own; and that in the 5th solo was never equalled. In the gavot-movements in the 2^d and 4th operas, the melody is distributed with great judgment among the several parts. In his minuets alone he seems to fail; Bononcini, Mr Handel, and Giuseppe Martini, have excelled him in this kind of airs.

It is said there is in every nation a style both in speaking and writing, which never becomes obsolete; a certain mode of phraseology, so consonant and congenial to the analogy and principles of its respective language, as to remain settled and unaltered. This, but with much greater latitude, may be said of music; and accordingly it may be observed of the compositions of Corelli, not only that they are equally intelligible to the learned and unlearned, but that the impressions made by them have been found to be as durable in general. His music is the language of nature; and, for a series of years, all that heard it became sensible of its effects: of this there cannot be a stronger proof than that, amidst all the innovations which the love of change had introduced, it continued to be performed, and was heard with delight in churches, in theatres, at public solemnities and festivities, in all the cities of Europe for near 40 years. Men remembered, and would refer to passages in it as to a classic author; and even at this day, the masters of the science do not hesitate to pronounce of the compositions of Corelli, that, of fine harmony and elegant modulation, they are the most perfect exemplars.

COREOPSIS, TICKSEED SUNFLOWER; a genus of the syngenesia order, belonging to the polygamia frustanea class of plants. There are 11 species, most of them herbaceous perennials. They are very flowery, and rise from three to eight feet stature; terminated by clusters of compound radiated flowers of a yellow colour. They have all perennial fibrous roots and annual stalks, which rise in the spring, flower from July to October, and decay to the root in November. The flowers are all shaped like sun-flowers, but smaller, and are very ornamental. They are easily propagated by slipping or dividing the roots in autumn, when the stalks decay; planting the slips at once where they are to remain; after which they will require no farther trouble than to be kept free from weeds, and have the decayed stalks cut annually in autumn.

CORFE-CASTLE, a borough-town in Dorsetshire in England. It takes its name from a strong castle, belonging to the crown, that stood there, but is now ruined. W. Long. 2. 8. N. Lat. 50. 33.

CORFU, an island in the Ionian sea, at the mouth of the gulf of Venice, formerly called *Corcyra* and *Phœcia*, famous for the gardens of Alcinoüs. It belongs at present to the Venetians; and forms the bulwark of Christendom against the Turks, who have often attempted to reduce it but without success. It is well fortified, and has 50 castles; and the number of the inhabitants is said to be about 50,000. The inhabitants are of the Greek church; and the Venetians send them a governor and magistrates, which are changed every two years. The soil is very fruitful, and produces a great deal of wine, olives, and several

other fruits, particularly figs, which are exceedingly good. The chief city is likewise called *Corfu*; see the following article.

CORFU, a city of the island of that name, belonging to the Venetians. It is a large place; and is well fortified with walls to the south, where there are two fortresses, one to the east, and another to the west. There are no fortifications on the side of the haven, nor are they necessary. Here the Venetian general of the Levant resides, under whom are the providors of Zante, Cephalonia, &c. The inhabitants of this city are said to be very revengeful, never forgiving an injury; and hence quarrels among them are hereditary. There is always a garrison here of 4000 men. E. Long. 19. 48. N. Lat. 39. 50.

CORIA, a town of Spain, in the kingdom of Leon and province of Eltramadur, towards the confines of Portugal, with a bishop's see. It is seated on a little river called *Alagon*, in a very fertile plain. There is nothing remarkable but the cathedral church, except at a little distance a river without a bridge, and a bridge without a river. This was caused by an earthquake, which turned the river another way. W. Long. 6. 46. N. Lat. 39. 59.

CORIANDRUM, CORIANDER; a genus of the digynia order, belonging to the pentandria class of plants: There are only two species, both of them herbaceous annuals, the leaves of which are useful for the kitchen, and the seeds for medicine. Both species have divided small leaves, somewhat resembling parsley: but there is but one species generally cultivated; namely, the *sativum*. This hath a small, fibrous white root, crowned by many parted leaves, having broadish segments; and in the centre an upright, round, branchy stalk, two feet high, having all the branches terminated by umbels of flowers, which are succeeded by globular fruit. It is propagated by seed, which when a good crop is wanted, ought to be sown in March either in drills a foot asunder, or by broad-cast, and then raked in. When the plants are an inch or two high, they should be hoed to six or eight inches distance. The seeds when fresh have a strong disagreeable smell, which improves by drying, and becomes sufficiently grateful: they are recommended as carminative and stomachic. The leaves are sometimes used for culinary purposes in soups, and as an ingredient in salads; but as they are of a fetid smell, they are held in no great esteem in this country.

CORIARIA, the *Tanner's*, or *Myrtle-leaved SUMACH*; a genus of the decandria order, belonging to the diœcia class of plants. There are two species, the myrtifolia and the fœmina. They are both natives of the south of France, but the former is most commonly cultivated in this country. It is a pretty ornamental plant, with a shrubby, pithy brown stem, closely branching from the bottom, and forms a bushy head three or four feet over, thickly garnished with oblong, pointed, bright green leaves, having small spikes of whitish flowers at the ends of the branches. It is easily propagated by suckers from the root, which it affords plentifully, and may be taken off with fibres every autumn or winter. It may be also propagated by layers in autumn, which will take root in a year. It is much used in the south of France, where it natu-

Corfu
|
Coriaria.

Corinna
Corinth.

rally grows, for tanning of leather, whence its name of tanner's smutch. It also dyes a beautiful black colour. The berries are dangerous, and when eaten generally occasion vertiges and epilepsies. The old leaves have the same effect upon cattle that eat them, but the young leaves are innocent.

CORINNA, a Grecian lady, celebrated for her beauty and poetic talents, was born at Theffu a city of Boeotia, and was the disciple of Myrtis another Grecian lady. Her verses were so esteemed by the Greeks, that they gave her the name of the lyric muse. She lived in the time of Pindar, about 495 years before Christ; and is said to have gained the prize of lyric poetry from that poet: but Pausanias observes that her beauty made the judges partial.

CORINTH, a celebrated city of antiquity, for some time the most illustrious of all the Greek cities. It is said to have been founded 1514 years before Christ, by Sisyphus the son of Eolus, and grandfather of Ulysses. Various reasons are given for its name, but most authors derive it from *Corinthus* the son of Pelops. It was situated in the fourth part of the Isthmus which joins the Peloponnesus, now the Morea, to the continent. It consisted of a citadel built upon an eminence, and thence named *Acrocorinthus*; besides which it had two maritime towns subject to it, named *Lecheum* and *Cenchrea*. The whole state extended scarce half a degree in length or breadth; but so advantageously were the above-mentioned ports situated, that they might have gained the Corinthians a superiority, if not a command, over all Greece, had not their advantageous situation inclined them to commerce rather than war. For their citadel was almost impregnable; and, commanding both the Ionian and Egean seas, they could easily cut off all communication from one half of Greece with the other; for which reason this city was called, one of the fetters of Greece.

But as the genius of the Corinthians led them to commerce rather than martial exploits, their city became the finest in all Greece. It was adorned with the most sumptuous buildings, as temples, palaces, theatres, porticoes, &c. all of them enriched with a beautiful kind of columns, which from the city were called *Corinthian*. But though the Corinthians seldom or never engaged in a war with a view of enlarging, but rather of defending, their little state, they did not forget to cultivate a good discipline both in time of peace and of war. Hence many brave and experienced generals have been furnished by Corinth to the other Grecian cities, and it was not uncommon for the latter to prefer a Corinthian general to any of their own.

This city continued to preserve its liberty till the year before Christ 146, when it was pillaged and burnt by the Romans. It was at that time the strongest place in the world; but the inhabitants were so disheartened by a preceding defeat, and the death of their general, that they had not presence of mind enough even to shut their gates. The Roman consul, Mummius, was so much surprised at this, that at first he could scarce believe it; but afterwards fearing an ambuscade, he advanced with all possible caution. As he met with no resistance, his soldiers had nothing to do but destroy the few inhabitants who had not fled, and plan-

der the city. Such of the men as had staid, were all put to the sword, and the women were sold for slaves. After this the city was rankled by the greedy soldiers, and the spoils of it are said to have been immense. There were more vessels of all sorts of metal, more fine pictures, and statues done by the greatest masters, in Corinth, than in any other city in the world. All the princes of Europe and Asia, who had any taste in painting and sculpture, furnished themselves here, with their richest moveables: here were cast the finest statues for temples and palaces, and all the liberal arts brought to their greatest perfection. Many inestimable pieces of the most famous painters and statuary fell into the hands of the ignorant soldiers, who either destroyed them or parted with them for a trifle. Polybius the historian was an eye-witness to this barbarism of the Romans. He had the mortification to see two of them playing at dice on a famous picture of Arifides, which was accounted one of the wonders of the world. The piece was a *Bacchus*, so exquisitely done, that it was proverbially said of any extraordinary performance, "it is as well done as the *Bacchus of Arifides*." This masterly piece of painting, however, the soldiers willingly exchanged for a more convenient table to play upon: but when the spoils of Corinth were put up to sale, Attalus king of Pergamus offered for it 600,000 sesterces, near 5000 l. of our money. Mummius was surprised at such a high price offered for a picture, and imagined there must be some magical virtue in it. He therefore interposed his authority, and carried it to Rome, notwithstanding the complaints of Attalus. Here this famous picture was lodged in the temple of Ceres, where it was at last destroyed by fire, together with the temple. Another extraordinary instance of the stupidity of Mummius is, that when the pictures were put on board the transports, he told the masters of the vessels very seriously, that if any of the things were either lost or spoiled, he would oblige them to find others at their own cost; as if any other pieces could have supplied the loss of those inestimable originals, done by the greatest masters in Greece. When the city was thoroughly pillaged, fire was set to all the corners of it at the same time. The flames grew more violent as they drew near the centre, and at last uniting there made one prodigious conflagration. At this time the famous metalline mixture is said to have been made, which could never afterwards be imitated by art. The gold, silver, and brass, which the Corinthians had concealed, were melted, and ran down the streets in streams, and when the flames were extinguished, a new metal was found, composed of several different ones, and greatly esteemed in after ages. The walls of the city were then demolished, and rased to the foundation; but the city was rebuilt again by Julius Cæsar, and made a Roman colony. It continued subject to the Roman emperors till the division of the empire, after which it fell to the share of those of Constantinople. On the decline of that empire it fell to the Venetians, but was taken from them by Mohammed II. The Venetians retook it in 1678; but the Turks became masters of it again in 1715, and have kept it ever since. It is now greatly decayed; for the houses are not contiguous, but intermixed with fields

Corinth.

and

Corinth
Coris.

and gardens, which make it look like a village. The country about it abounds with corn, wine, and oil; and from its cattle, is one of the finest prospects in the world, over the sea to the east and west, and a fertile country to the north and south. The narrowest part of the isthmus, on which it stands, is above six miles over. There are still to be seen the ruins of the temples dedicated to the Sun, Pluto, Diana, Neptune, Ceres, and Bacchus. The inhabitants are most of them Christians, of the Greek church, who are allowed liberty of conscience by the Turks. E. Long. 28. 13. N. Lat. 38. 14.

CORINTH, (the isthmus of), in the Morea, is a neck of land which joins the Morea to Greece, and reaches from the gulph of Lepanto to that of Egina. Julius Cæsar, Caligula, and Nero, attempted to cut a channel through it, but in vain; and they therefore afterwards built a wall across it, which they called Hexamilium, because it was six miles in length. This was demolished by Amurat II. and afterwards rebuilt by the Venetians, but was levelled a second time by Mahomet II.

CORINTHIAN, in general, denotes something belonging to Corinth: thus we say, Corinthian brags, Corinthian order, &c.

CORINTHIAN Order, in architecture, the fourth order of architecture, according to Scamozzi; but Mr le Clerc makes it the fifth, being the most noble and delicate of all the other five. See ARCHITECTURE, n^o 52.

CORIO (Bernardine), an historian born of an illustrious family at Milan, in the year 1460. He was secretary of state to that duchy; and the duke of Lavis Storza appointed him to write the history of Milan. He died in 1500. The best edition of his history is that of 1503, in folio. It is printed in Italian, and is very scarce.

CORIOLANUS (C. Marcius), a famous Roman captain, took Corioli a town of the Volsci, whence he had his surname: at last, disgusting the people, he was banished Rome by the tribune Decius. He went to the Volsci, and, persuading them to take up arms against the Romans, they encamped within four miles of the city. He would not listen to proposals of peace till he was prevailed upon by his wife Veturia, and his mother Volumnia, who were followed by all the Roman ladies in tears. He was put to death by the Volsci as a traitor that had made them quit their conquest: upon which the Roman ladies went into mourning; and in the same place where his blood was spilled, there was a temple consecrated to feminine virtue.

CORIS, in botany, a genus of the monogynia order belonging to the pentandria class of plants, for which there is no English name. There is only one species, viz. the *montpellierensis*, or blue maritime coris. There are two varieties of this plant, one with a red, and the other with a white flower; but these are only accidental, and arise from the same seeds. They grow wild about Montpellier, and in most places in the south of France: they seldom grow above six inches high, and spread near the surface of the ground like heath; and in June, when they are full of flowers, make a very pretty appearance. They may be propagated by sowing their seeds in a bed of fresh earth, and afterwards removing the young plants, some into pots,

and others into a warm border. They generally bear our winter colds well enough, but severe frosts will sometimes destroy them; for which reason it is proper to keep some of them in pots, which should be put under a hot-bed frame in winter. As they seldom produce good seeds in this country, they may, in want of these, be propagated by slips and cuttings, which will take root if planted on a very gentle hot-bed, shaded from the sun and duly watered.

CORISPERMUM, TICKSEED, a genus of the digynia order belonging to the monandria class of plants. There are two species; but none of them are remarkable for their beauty or any other quality.

CORK, or CORK-TREE, in botany. See QUERCUS. Fossil-CORK, a name given to a kind of stone. It seems to be a species of amianthus, consisting of flexible fibres loosely interwoven, and somewhat resembling vegetable cork. It is the lightest of all stones; by fire it is fusible, and forms a black glass. It possesses the general qualities of amianthus. See that article.

CORK, in Latin *comitatus Corcagensis*, a county of the province of Munster in Ireland. It is the most populous and considerable county of the kingdom next to that of Dublin; containing near a million of acres, and being divided into 15 baronies. It is bounded on the east by the county of Waterford; on the west by the ocean; by Limerick on the north; and by the Vergivian sea on the south and south-east. Including Desmond it is 85 miles in length, and 50 in breadth; but is very unequal both ways. Though a considerable part of the country is boggy, mountainous, and barren; yet by the industry of the inhabitants it is pretty well cultivated and improved, and contains several good towns and harbours.

CORK, a city of Ireland, and capital of the county of that name. It is an episcopal see; and is the largest and most populous of any in the kingdom, Dublin alone excepted. It is situated on the river Lee, 15 miles from its mouth, and is a place of great trade. Though smaller vessels can come up to the key, yet the larger generally ride at a place called *passage*. The houses in general are well built, but many of the streets are too narrow. Its churches are unexceptionably the neatest and most elegantly finished of any in the kingdom. This city, together with its liberties, makes a county. It was built, or rather fortified, by the Danes, in the ninth century. The greatest part of it stands on a marshy island surrounded by the river Lee, which also runs through the city, and divides it into several canals. On this account some have thought the air very moist and unwholesome. Complaints have also been made against the water as impure; but, from comparing the bills of mortality with those of other cities, it appears that the city of Cork is far from being unhealthy. This hath been accounted for from the influx of the tide, by which a stagnation of air is prevented. The first charter of Cork was bestowed by Henry III. and afterwards ratified by Edward I. Edward II. and Edward III. Edward IV. granted a new charter; and the city received many favours from the succeeding monarchs. King James I. gave the citizens a new and ample charter; and king Charles I. what is called the Great Charter, by which, among others, a clause in king James's charter was enforced, making
this

Cormandel.

this city a county of itself. Though a garrison, it was never a place of much strength, as appeared at the revolution. It was then reduced in a short time by Marlborough; and the troops that were then in it, to the number of 4 or 5000, made prisoners of war. The last royal charter was granted in 1735, by which all the aldermen that had passed the chair were empowered to act as justices of peace. The inhabitants in general are active and industrious; carrying on various manufactures, and a great inland trade, especially for live cattle. But the wealth and grandeur of Cork arises chiefly from its excellent harbour, where almost any number of ships may lie with safety. According to some accounts, in times of peace, 1200 vessels have been known to resort to this harbour in a year. Ships from England, bound to all parts of the West Indies, take in here a great part of their provisions; and on the same account the haven of Cork is visited by those of most other nations. The merchants of Cork carry on a very extensive foreign trade, which is daily increasing. Vast quantities of salt beef are exported from this place. The slaughtering season continues from the month of August to the end of January; during which space it has been computed that they kill seldom fewer than 100,000 head of black cattle. The rest of their exports consist of butter, candles, hides raw and tanned, linen-cloth, pork, calves, lambs, and rabbit-skins, tallow, wool for England, linen and woolen yarn, worsted, &c. Notwithstanding all this, however, the city of Cork is exposed to some inconveniences from its situation, particularly to inundations. It is situated in W. Long. 8. 25. N. Lat. 51. 40.

CORK JACKET, or **Waiscoat**, is an invention of one Mr Dubourg, a gentleman very fond of swimming, but subject to the cramp, which led him to consider of some method by which he might enjoy his favourite diversion with safety. The waiscoat is composed of four pieces of cork, two for the breasts, and two for the back; each pretty near in length and breadth to the quarters of a waiscoat without flaps; the whole is covered with coarse canvas, with two holes to put the arms through: there is a space left between the two back pieces, and the same betwixt each back and breast piece, that they may fit the easier to the body. Thus the waiscoat is open only before, and may be fastened on the wearer with strings, or, if it should be thought more secure, with buckles, and leather straps. This waiscoat does not weigh above 12 ounces, and may be made up for about 5 or 6 shillings expence. Mr Dubourg tried his waiscoat in the Thames, and found that it not only supported him on the water, but that two men could not sink him, though they used their utmost efforts for that purpose. If those who use the sea occasionally, and especially those who are obliged to be almost constantly there, were to have those waiscoats, it would be next to impossible that they should be drowned. It would also be of vast service to those that, for the sake of health, bathe in the sea; and even the most delicate and timorous young lady might by the help of one of these jackets venture into a rough sea. See **AIR-JACKET**, and **BAMBOO-HABIT**.

CORMANDEL. See **COROMANDEL**.

CORMORANT, a corruption of *Corvorant*, in or- **Cormorant**
nithology. See **PILICANUS**.

CORN, in country affairs, the grain or seeds of plants separated from the spike, or ear, and used for making bread.

There are several species of corn, such as wheat, rye and barley, millet and rice, oats, maize and lentils, pease, and a number of other kinds, each of which has its usefulness and propriety. Corn is very different from fruits, with respect to the manner of its preservation; and is capable of being preserved in public granaries, for pressing occasions, and of being kept for several centuries.

The first method is to let it remain in the spike; the only expedient for conveying it to the islands and provinces of America. The inhabitants of those countries save it in the ear, and raise it to maturity by that precaution: but this method of preserving it, is attended with several inconveniences among us; corn is apt to rot or sprout, if any the least moisture is in the heap; the rats likewise infest it, and our want of straw also obliges us to separate the grain from the ear. The second is to turn out and winnow it frequently; or to pour it through a trough or mill-hopper, from one floor to another; being thus moved and aired every 15 days, for the first 6 months, it will require less labour for the future, if lodged in a dry place: but if, through neglect, mites should be allowed to slide into the heap, they will soon reduce the corn to a heap of dust: this must be avoided by moving the corn anew, and rubbing the places adjacent with oils and herbs, whose strong odour may chase them away; for which garlic and dwarf-elder are very effectual: they may likewise be exposed to the open sun, which immediately kills them. When the corn has been preserved from all impurities for the space of two years, and has exhaled all its fires, it may be kept for 50 or even 100 years, by lodging it in pits covered with strong planks, closely joined together: but the safer way is to cover the heap with quick-lime, which should be dissolved by sprinkling it over with a small quantity of water; this causes the grains to shoot to the depth of two or three fingers; and incloses them with an incrustation, through which neither air nor insects can penetrate.

Corn not exceeding the under-mentioned prices have the following bounties per quarter, viz.

	Price per q ^r .		Bounty per q ^r .	
	l.	s.	s.	d.
Wheat	2	8	5	0
Rye	1	12	3	6
Barley and Malt	1	4	2	6
Oat-meal	0	15	2	6

In France corn of the growth of the kingdom is reckoned a contraband commodity.

Indian CORN or maize. See **ZEAL**.

CORN-Butterfly, method of destroying it. See **AGRICULTURE**, n^o 76.

CORN-Grass. See **RALLUS**.

CORN-Mill, a water-engine for grinding of corn. See **MECHANICS**.

CORN, in medicine and surgery, a hard tubercle like a flat wart, growing in several parts of the feet, especially

Corn
||
Corneille.

cially upon the joints of the toes. See (*Index* subjoined to) *MEDICINE*.

CORN, in farriery. See *FARRIERY*, § xliii.

CORNAGE, an ancient tenure, the service whereof was to blow a horn when any invasion of the Scots was perceived. This tenure was very frequent in the northern counties near the Picts wall.

CORNARIUS, or HAGUENBOT, (John), a celebrated German physician, born at Zwickow, in Saxony. His preceptor made him change his name of Haguenbot to that of Cornarius, under which he is most known. At 20 years of age he taught grammar, and explained the Greek and Latin poets and orators to his scholars; and at 23, was licentiate in medicine. He found fault with most of the remedies provided by the apothecaries; and observing, that the greatest part of the physicians taught their pupils only what is to be found in Avicenna, Rasis, and the other Arabian physicians, he carefully sought for the writings of the best physicians of Greece, and employed about 15 years in translating them into Latin, especially the works of Hippocrates, Aëtius, Eginetes, and a part of those of Galen. Meanwhile he practised physic with reputation at Zwickow, Francfort, Marburg, Nordhausen, and Gena, where he died of an apoplexy in 1558, aged 58. He also wrote some medicinal treatises; published editions of some poems of the ancients on medicine and botany; and translated some of the works of the fathers, particularly those of Basil, and a part of those of Epiphanius.

CORNARO (Lewis), a Venetian of noble extraction, memorable for having lived healthful and active to above 100 years of age by a rigid course of temperance. By the ill conduct of some of his relations he was deprived of the dignity of a noble Venetian; and seeing himself excluded from all employments under the republic, he settled at Padua. In his youth, he was of a weak constitution; and by irregular indulgence reduced himself, at about 40 years of age, to the brink of the grave, under a complication of disorders; at which extremity he was told that he had no other chance for his life, but by becoming sober and temperate. Being wise enough to adopt this wholesome counsel, he reduced himself to a regimen of which there are very few examples. He allowed himself no more than 12 ounces of food, and 14 ounces of liquor each day; which became so habitual to him, that when he was above 70 years of age, the experiment of adding two ounces to each by the advice of his friends, had like to have proved fatal to him. At 83, he wrote a treatise which has been translated into English, and often printed, intitled, *Sure and certain Methods of attaining a Long and Healthful Life*; in which he relates his own story, and extols temperance to a degree of enthusiasm. At length, the yolk of an egg became sufficient for a meal, and sometimes for two, until he died with much ease and composure in 1566. The writer of the *Spectator*, N° 195, confirms the fact from the authority of the Venetian ambassador at that time, who was a descendant of the Cornaro family.

CORNEA TUNICA. See *ANATOMY*, n° 406. c.

CORNEILLE (Peter), a celebrated French poet, was born at Rouen, in the year 1606. He was

brought up to the bar, which he attended for some little time; but, formed with a genius too elevated for such a profession, and having no turn for business, he soon deserted it. An affair of gallantry occasioned his writing his first piece, intitled, *Mélite*; which had prodigious success. Encouraged by the applause of the public, he wrote the *Cid*, and the other tragedies that have immortalized his name. In his dramatic works he discovers a majesty, a strength and elevation of genius, scarce to be found in any other of the French poets; and, like our immortal Shakespeare, seems better acquainted with nature, than with the rules of critics. Corneille was received into the French academy in 1647, and died dean of that academy in 1784, aged 78. Besides his dramatic pieces, he wrote a translation, in French verse, of the "Imitation of Jesus Christ," &c. The best edition of his works is that of 1682, in 4 vols 12^{mo}.

CORNEILLE (Thomas), brother of the former, was a member of the French academy, and of that of inscriptions. He discovered in his youth a great inclination to poetry; and at length published several dramatic pieces, in five volumes duodecimo, some of which were applauded by the public, and acted with success. He also wrote, 1. A translation of Ovid's *Metamorphoses*, and of some of Ovid's *Epistles*. 2. *Remarks on Vauglas*. 3. *A Dictionary of Arts*, two volumes folio; and, 4. *An universal, geographical, and historical Dictionary*, in three volumes folio.

CORNEILLE (Michael), a celebrated painter, was born at Paris, in the year 1642; and was instructed by his father, who was himself a painter of great merit. Having gained a prize at the academy, young Corneille obtained a pension from Lewis XIV.; and was sent to Rome, where that prince had founded a school for young artists of genius. Having studied there some time, he gave up his pension, and applied to the antique with great care. He is said to have equalled Carache in drawing; but in colouring he was deficient. Upon his return from Rome, he was chosen professor in the academy of Paris; and was employed by the above prince in all the great works he was carrying on at Versailles and Trianon, where are still to be seen some noble efforts of his genius.

CORNEL-TREE, in botany. See *CORNUS*.

CORNELIAN. See *CARNELIAN*.

CORNER, in a general sense, the same with *ANGLE*.

CORNET, in the military art of the ancients, an instrument much in the nature of a trumpet; which when it only sounded, the ensigns were to march alone, without the soldiers; whereas, when the trumpet only sounded, the soldiers were to move without the ensigns. The cornets and buccinæ sounded the charge and retreat; and the cornets and trumpets sounded during the course of the battle.

CORNET, in the military art of the moderns, the third commission-officer in a troop of horse or dragoons.

This is a very honourable post: he commands in the lieutenant's absence; his principal duty being to carry the standard, near the middle of the first rank of the squadron.

CORNEUS, the name by which Linnæus calls a kind

Corneille:
||
Cornus.

Corniche
&
Cornus.

kind of *tin-ore*, found in black columns, with irregular sides, and terminating in prisms.

CORNICHE, CORNISH, or CORNICE, in architecture, the uppermost member of the entablature of a column, as that which crowns the order. See ARCHITECTURE, Chap. I. and the Plates.

CORNICHE, is also used, in general, for all little projectures in masonry or joinery, even where there are no columns, as the corniche of a chimney, beautiful, &c.

CORNICHE-Ring, a piece of ordnance, is that next from the muzzle-ring, backward.

CORNISH DIAMOND. See DIAMOND.

CORNICULARIUS, in Roman antiquity, an officer of the army, appointed to assist the military tribune in quality of lieutenant.

CORNIX, in ornithology, the trivial name of a species of *CORVUS*.

CORNU. See HORN.

CORNU Ammonis, in natural history, fossil shells, called also *serpent-stones*, or *snake-stones*.

They are found of all sizes, from the breadth of a sixpence, to more than two feet in diameter; some of them rounded, others greatly compressed, and lodged in different strata of stones and clays; some again are smooth, and others ridged in different manners, their striz and ridges being either straight, irregularly crooked, or undulated. See SNAKE-STONE.

CORNU Cervi. See HARTSHORN.

CORNUCOPIA, or HORN OF PLENTY, among painters, &c. is represented under the figure of a large horn, out of which issue fruits, flowers, &c. Upon medals the cornucopia is given to all deities, genii, and heroes, to mark the felicity and abundance of all the wealth procured by the goodness of the former, or the care and valour of the latter.

CORNUS, CORNEL-TREE, CORNELIAN CHERRY, or DOG-WOOD; a genus of the monogynia order, belonging to the tetrandria class of plants.

Species. Of this genus there are five species; the most remarkable are the following. 1. The mas, or cornelian cherry-tree, hath an upright tree-stem, rising 20 feet high, branching, and forming a large head, garnished with oblong leaves, and small umbels of yellowish-green flowers at the sides and ends of the branches, appearing early in the spring, and succeeded by small, red, cherry-like, eatable, acid, fruit. 2. The sanguinea, bloody-twigg, or common dog-wood; hath an upright tree-stem, branching 10 or 12 feet high, having blood-red shoots, garnished with oblong pointed nervous leaves two inches long; and all the branches terminated by umbellate white flowers succeeded by black berries, of this there is a kind with variegated leaves. 3. The florida, or Virginian dog-wood, hath a tree-stem branching 12 or 15 feet high, and fine red shoots garnished with large heart-shaped leaves; and the branches terminated by umbellate white flowers, having a large involucre succeeded by dark red berries. Of this species there are several varieties, chiefly distinguished by the colour of their berries, which are red, white, or blue.

Culture. All the species may be propagated by seeds, which ought to be sown in autumn, otherwise they will lie a year in the ground. When the plants

come up, they should be duly watered in dry weather, and kept clean from weeds. The following autumn they may be transplanted into the nursery; and having remained there two or three years, they may then be removed to the places where they are to remain. They may also be propagated by suckers, of which they produce great plenty, or by laying down the young branches.

CORNUTIA, in botany, a genus of the digynia order, belonging to the triandria class of plants. There is but one species, viz: the pyramidata, with a blue pyramidal flower, and hoary leaves. It grows plentifully in several of the islands of the West-Indies, also at Campeachy, and at La Vera Cruz. It rises to the height of 10 or 12 feet, with rude branches, the leaves being placed opposite. The flowers are produced in spikes at the end of the branches, and are of a fine blue colour. They usually appear in autumn, and will sometimes remain in beauty for two months or more. It is propagated either by seeds or cuttings, and makes a fine appearance in the stove; but is too tender to bear the open air in this country.

CORNWAL, the most westerly county of England, bounded by the English channel on the south, St George's channel on the west, the Bristol channel on the north, and on the east by the river Tamar, which separates it from Devonshire. Its name is supposed by some to be compounded of *corn*, signifying "a rock" in the British language, and *Gaulis*, or *Wales*, the name the Saxons gave to the Britons. Others, however, think it is derived from the Latin *cornu*, the name the British kern, "a horn;" on account of its running out into the sea somewhat in the form of a horn. It is computed to be 70 miles in length, 40 in breadth where broadest, and not five in the narrowest part. Dr Campbell, however, in his Political Survey of Great Britain, is of opinion that this county is much larger than our accounts commonly make it. In respect of size, he thinks it is equal at least to the duchy of Parma; and but little, if at all, inferior to the island of Majorca. There is a tradition in this county with regard to its former extent, which Dr Campbell is also inclined to believe, namely, that there was anciently a tract of ground called the *Liones*, extending towards the Scilly islands, but now covered with water. At present, Cornwall contains 21 parliamentary boroughs; 27 market towns; between 12 and 1300 villages, and upwards of 120,000 inhabitants.

As Cornwall is surrounded by the sea on all sides except the east, its climate is somewhat different from that of the other parts of Britain. The reasons of this difference will be easily understood from what is observed concerning the climate of America*. The summers in Cornwall are less hot, and the winters less cold, than in other parts of England, and the spring and harvest are observed to be more backward. High and sudden winds are also more common in this than in other counties of England. The county is rocky and mountainous; but the mountains are rich in metals, especially tin and copper. The valleys are very pleasant and fertile, yielding great plenty both of corn and pasture. The lands near the sea-coast are manured and fertilized with sea-weed, and a kind of sand formed by the particles of broken shells as they are dashed

—24.

Cornwal
Corollary.

dafted againft each other by the fea. Here are great plenty of copper, tin, and lead mines, moor-ftones, lapis calaminaris for making brafs, cornifh diamonds, and a yellow ore called *mundick*, whence copper and lapis calaminaris are extracted. Cattle of all forts are fmaller here than in the other counties of England; and the wool of the fheep, which are moftly without horns, is very fine, and the flefh, both of them and of the black cattle, extremely delicate. The country is well fupplied with fifh from the fea and the many rivers with which it is watered. The moft noted of the fea-fifh is the pilchard; of which prodigious quantities are caught from July to November, and exported to different parts, efpecially to Spain. It is faid that a million have been fometimes taken at a fingle draught. The natives are remarkable for their ftrength and activity, as well as their dexterity in wrrelling, in which exercife the Cornifh hug is highly extolled.

The tin dug from the Cornifh mines is melted into pigs of three or four hundred weight, each of which is ftamped with the owner's name. There are five towns, Lefkard, Leftwithel, Truro, Helton, and Penzance, where the tin is effayed and marked at Midfummer and Michaelmas, or Lady-day and Chriftnas, with the feal of the duchy of Cornwal. When it is thus marked, and the duty of four fhillings for every hundred weight paid, the tinner may difpofe of it as he pleafes; only the king, or duke of Cornwal, are to have the preference, if they chufe to be purchafers. The caufes arifing among the tinner are tried by juries, returned by the mayors of the ftannary or coinage towns, before the lord-warden or his deputy. They have had many privileges beftowed upon them by the kings and dukes of Cornwal, in confideration of the high duty they pay, and for encouraging them in their laborious and difagreeable bufinefs of mining. Ever fince Edward III. created his eldeft fon duke of Cornwal, the eldeft fons of the kings of England have enjoyed that title. They have royal prerogatives and privileges in the duchy, fuch as the nomination of its fheriff, a right to the duty on tin, wrecks, cuftoms, &c. Though this county is much inferior to fome others in point of populoufnefs and wealth, particularly Yorkfhire and Middlefex, yet it fends a far greater number of members to parliament, *viz.* 44, which is nearly equal to the number fent from Scotland, and double to that fent from Wales. This great difproportion, fo dangerous to the conftitution, is attributed to the partiality of the kings, on account of the great revenue they received from it, or to the intereft of its ancient dukes. Of the boroughs which fend members to parliament, fome are fo inconfiderable as to have no church.

COROLLA, among botanifts, the moft confpicuous part of a flower, furrounding the organs of generation, and compofed of one or more flower-leaves, moft commonly called *petals*, to diftinguifh them from the leaves of the plant; according as there is one, two, or three of thefe petals, the corolla is faid to be monopetalous, dipetalous, tripetalous, &c.

COROLLARY is a confequence drawn from fomething already advanced or demonftrated: thus, it being demonftrated that a triangle which has two equal fides, has alfo two angles equal; this corollary will follow, that a triangle which has three

fides equal, has alfo its three angles equal.

COROLLISTÆ, a name by which Linnæus diftinguifhes thofe fyftematic botanifts who have arranged vegetables from the regularity, figure, number, and other circumftances, of the petals, or beautiful coloured leaves of the flower. The beft fyftems of this kind are thofe of Rivinus and Tournefort. The former proceeds upon the regularity and number of the petals; the latter, with much more certainty, on their regularity and figure.

COROLLULÆ, a term ufed by botanifts to exprefs the little partial flowers which make up the compound ones.

COROMANDEL, the eaftern coaft of the peninfula on this fide the Ganges in Afia. It is bounded on the north by Golconda, on the eaft by the bay of Bengal, on the fouth by Madura, and on the weft by Bifnagar. This coaft fo much refembles that of Orixá, that the Abbé Raynal choofes to confider them as one, and gives to both the general name of *Coromandel*. Here an exceffive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a fea-breeze from the fouth-eaft; and moft commonly this refrefhing gale begins at three in the afternoon. The air is lefs inflamed during the reft of the year, though in all feafons it is very hot. It rains almoft continually during the months of November and December. This immense traël is covered with a parched fand for the extent of two miles, and fometimes only one mile along the coaft.

This country was at firft neglected by the Europeans for many reafons. It was feparated by inacceffible mountains from Malabar, where thefe bold adventurers endeavoured to fettle themfelves. Spices and aromatics, which were the principal objects of their attention, were not to be found there. In fhort, civil diffentions had banifhed from it tranquillity, fecurity, and induftry. At that period the empire of Bifnagar, to which this vaft country was fubject, was falling to ruin. The governments of Vifapour, the Carnatic, Golconda, and Orixá, threw off their dependence, and affumed the title of kings. Thofe of Madura, Tanjore, Myfore, Glngi, and fome others, likewise ufurped the fovereign authority, though they retained their ancient title of *Naick*. This revolution had juft happened when the Europeans appeared on the coaft of Coromandel. The foreign trade was at that time inconfiderable; it confifted only of diamonds from Golconda, which were carried to Calicut and Surat, and from thence to Ormus or Suez, whence they were circulated through all Europe and Afia. Mafulipatan, the richeft and moft populous city of thefe countries, was the only market that was known for linens; they were purchafed at a great fair annually holden there by the Arabian and Malayan veffels that frequented that bay, and by caravans arrived from diftant parts. The linens were exported to the fame places with the diamonds. The fondnefs for the manufactures of Coromandel which began to prevail here, infpired all the European nations trading to the Indian feas with the refolution of forming fettlements there. They were not difcouraged either by the difficulty of conveying goods from the inland parts of the

Corollinæ
|
Coromand-
del.

Coroman-
del.

country, where there was no navigable river; by the total want of harbours, where the sea at one season of the year is not navigable; by the barrenness of the coasts, for the most part uncultivated and uninhabited; nor by the tyranny and fluctuating state of the government. They thought that silver would be industriously fought after; that Pegu would furnish timber for building, and Bengal, corn for subsistence; that a prosperous voyage of nine months would be more than sufficient to complete their ladings; and that by fortifying themselves they should be secure against the attacks of the weak tyrants that oppressed these countries.

The first European colonies were established near the shore. Some of them obtained a settlement by force; most of them were formed with the consent of the sovereigns; and all were confined to a very narrow tract of land. The boundaries of each were marked out by a hedge of thorny plants, which was their only defence. In process of time fortifications were raised; and the security derived from them, added to the lenity of the government, soon increased the number of colonists. The splendor and independence of these settlements several times raised the jealousy of the princes in whose dominions they were formed; but their attempts to demolish them proved abortive. Each colony increased in prosperity in proportion to the riches and the wisdom of the nation that founded it. None of the companies that exercised an exclusive privilege beyond the Cape of Good Hope had any concern in the trade of diamonds. This was always left to private merchants, and by degrees fell entirely into the hands of the English, or the Jews and Armenians that lived under their protection. At present this grand object of luxury and industry is much reduced. The revolutions that have happened in Indostan have prevented people from resorting to these rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whole of the commercial operations on the coast of Coromandel is confined to the purchase of cottons. The manufacturing of the white cottons bought there, differs so little from ours, that it would be neither interesting nor instructive to enter into a minute description of it. The process used in making their printed cottons, which was at first servilely followed in Europe, has since been rendered more simple, and brought to greater perfection by our manufacturers. The painted cottons which are bought there, we have not yet attempted to imitate. Those who imagine we have been prevented from undertaking this branch merely by the high price of labour among us, are mistaken. Nature has not given us the wild fruits and drugs necessary for the composition of those bright and indelible colours which constitute the principal merit of the Indian manufactures; nor has she furnished us with the waters that serve to fix them. The Indians do not universally observe the same method in painting their cottons; either because there are some niceties peculiar to certain provinces, or because different soils produce different drugs for the same uses. We should tire the patience of our readers were we to trace the slow and painful progress of the Indians in the art of

painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What seems to authorize this conjecture is, that they have stopped in their improvements, and have not advanced a single step in the arts for many ages; whereas we have proceeded with amazing rapidity. Indeed, were we to consider only the want of invention in the Indians, we should be tempted to believe, that, from time immemorial, they have received the arts they cultivate from some more industrious nation; but when it is remembered that these arts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be convinced that they are natives of that country. It may appear somewhat surprising that cottons painted with all sorts of colours should be sold at so moderate a price, that they are almost as cheap as those that have only two or three. But it must be observed, that the merchants of the country sell to all the companies a large quantity of cottons at a time; and that the demand for cottons painted with various colours makes but a small article in their assortments, as they are not much esteemed in Europe.

Though cottons of all sorts are in some degree manufactured throughout the whole country of Indostan, which extends from Cape Comorin to the banks of the Ganges; it is observable, that the fine sorts are made in the eastern part, the common ones in the centre, and the coarse ones in the most western parts. Manufactures are established in the European colonies, and upon the coast: they are more frequent at the distance of five or six leagues from the sea, where cotton is more cultivated, and provisions are cheaper. The purchases made there are carried 30 or 40 leagues farther into the country. The Indian merchants settled in the European factories have always the management of this business. The quantity and quality of the goods wanted are settled with these people: the price is fixed according to the patterns; and, at the time a contract is made, a third, or a fourth part of the money agreed on is advanced. This arrangement is owing to the necessity these merchants themselves are under of advancing money to the workmen by the partners or agents who are dispersed through the whole country; of keeping a watchful eye upon them, for fear of losing what they have advanced; and of gradually lessening the sum, by calling for the cottons as fast as they are worked off. Without these precautions, nothing could be depended on in an oppressive government, where the weaver cannot work on his own account, either because his circumstances will not permit, or because he dares not venture to discover them for fear of exactions. The companies that have either success, or good management, constantly keep the stock of one year in advance in their settlements. By this method they are sure of having the quantity of goods they have occasion for, and of the quality they choose, at the most convenient time; not to mention that their workmen, and their merchants, who are kept in constant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their ships. They have only five or six months at most to execute the orders sent from Europe. The goods

Coroman-
del.

goods are manufactured and examined in haste; and they are even obliged to take such as are known to be bad, and would be rejected at any other time. The necessity they are under of completing their cargoes, and fitting out their vessels before hurricanes come on, leaves no room for nicety of inspection. It would be a mistake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of selling them with a reasonable advantage to the company with whom they are engaged. For, besides that the generality of them are not rich enough to embark in so large an undertaking, they would not be certain of finding their account in it. If the company that employ them should be hindered by unforeseen accidents from sending the usual number of ships, these merchants would have no vent for their commodities. The Indians, the form of whose dress requires different breadths and lengths from those of the cottons fabricated for our use, would not purchase them; and the other European companies would be provided, or certain of being provided, with whatever the extent of their trade required, and their money enabled them to purchase. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be useful. It has been a custom, time immemorial, in Indostan, for every citizen who borrows money, to give a written instrument to his creditor. This deed is of no force in a court of judicature, unless it is signed by three witnesses, and bears the day of the month, and the year when it was made, with the rate of interest agreed upon by the parties. If the borrower fails to fulfil his engagements, he may be arrested by the lender himself. He is never imprisoned, because there is no fear of his making his escape. He would not even eat, without obtaining leave of his creditor. The Indians make a three-fold division of interest: one kind they call *vice*; another neither *vice* nor *virtue*; and a third, they say, is *virtue*. The first is four *per cent.* a month; the second two; and the third one. The last is, in their opinion, an act of beneficence that only belongs to the most heroic minds. Yet, though the Europeans, who are forced to borrow, meet with this treatment, it is plain they cannot avail themselves of the indulgence without being involved in ruin.

The foreign trade of Coromandel is not in the hands of the natives. In the western part, indeed, there are Mohammedans known by the name of *Chalias*, who, at Naour, and Porto-Nuovo, send out ships to Acken, Merguy, Siam, and the Eastern coast. Besides vessels of considerable burden employed in these voyages, they have smaller embarkations for the coasting trade for Ceylon; and the pearl fishery. The Indians of Maffulipatan turn their attention another way. They import from Bengal white calicoes which they dye or print, and sell them again at the places from whence they had them, at 35 or 40 *per cent.* advantage. Excepting these transactions which are of very little consequence, the whole trade is vested in the Europeans, who have no partners but a few Banians and Armenians settled in their colonies. The quantity of calicoes exported from Coromandel to the different ports of India, may be computed at 3500 bales.

Of these the French carry 800 to Malabar, Mocha, and the isle of France; the English, 1200 to Bombay, Malabar, Sumatra, and the Philippine Islands; and the Dutch 1500 to their different settlements. Except 500 bales destined for Manila, each of the value of 100 guineas, the others are of such an ordinary kind that they do not exceed 30 guineas at prime cost; so that the whole number of bales do not amount to more than about L. 150,000.

Coromandel furnishes Europe with 9500 bales; 800 of which are brought by the Danes, 2500 by the French, 3000 by the English, and 3200 by the Dutch. A considerable part of these calicoes are dyed blue, or striped blue and red for the African trade. The others are fine muslins, printed calicoes, and handkerchiefs from Maffulipatan, or Pallacate. It is proved by experience that each of these bales costs only about L. 42 Sterling; consequently they ought to bring in to the manufactory where they are wrought, near L. 360,000. The payments are not entirely made in specie, either in Europe or Asia; we give in exchange, cloths, iron, lead, copper, coral, and some other articles of less value. On the other hand, Asia pays with spices, pepper, rice, sugar, corn, and dates. All these articles taken together may amount to about L. 210,000; and from this calculation it follows, that Coromandel receives annually from Europe about L. 300,000 in money. The British who have acquired the same superiority on this coast that they have elsewhere, have formed on it several settlements.

CORONA, among anatomists, denotes that edge of the glans penis, where the preputium begins.

CORONA, or *Halo*, in optics, a luminous circle, surrounding the sun, the moon, the planets, or fixed stars. Sometimes these circles are white, and sometimes coloured, like the rainbow. Sometimes one only is visible, and sometimes several concentric coronas make their appearance at the same time. Those which have been seen about Sirius and Jupiter were never more than three, four, or five degrees in diameter; those which surround the moon are, also, sometimes no more than three or five degrees; but these, as well as those which surround the sun, are of very different magnitudes, *viz.* of 12° 0', 22° 35', 30° 0', 38° 0', 41° 2', 45° 0', 46° 24', 47° 0', and 90°, or even larger than this. Their diameters also sometimes vary during the time of observation, and the breadths both of the coloured and white circles are very different, *viz.* of 2, 4, or 7 degrees.

The colours of these coronas are more dilute than those of the rainbow; and they are in a different order, according to their size. In those which Newton observed in 1692, they were in the following order, reckoning from the inside. In the innermost were blue, white, and red; in the middle were purple, blue, green, yellow, and pale red; in the outermost, pale blue, and pale red. Mr Huygens observed red next the sun, and a pale blue outwards. Sometimes they are red on the inside, and white on the outside. M. Weidler observed one that was yellow on the inside, and white on the outside. In France, one was observed in 1683, the middle of which was white; after which followed a border of red; next to it was blue, then green, and the outermost circle was a bright red.

Corona.

red. In 1728, one was seen of a pale red outwardly, then followed yellow, and then green, terminated by white.

These coronas are very frequent. In Holland, M. Muschenbroeck says, so may be seen in the day-time, almost every year; but they are difficult to be observed, except the eye be so situated, that not the body of the sun, but only the neighbouring parts of the heavens can be seen. Mr Middleton says, that this phenomenon is very frequent in North America; for that there is generally one or two about the sun every week, and as many about the moon every month. Halos round the sun are very frequent in Russia. M. Äpinus says, that, from the 23^d of April 1758, to the 20th of September, he himself had observed no less than 26, and that he has sometimes seen twice as many in the same space of time.

Coronas may be produced by placing a lighted candle in the midst of steam in cold weather. Also, if glass windows be breathed upon, and the flame of a candle be placed some feet from it, while the spectator is also at the distance of some feet from another part of a window, the flame will be surrounded with a coloured halo. And if a candle be placed behind a glass receiver, when air is admitted into the vacuum within it, at a certain degree of density, the vapour with which it is loaded will make a coloured halo round the flame. This was observed by Otto Guericke. In December 1756, M. Muschenbroeck observed that, when the glass windows of his room were covered with a thin plate of ice on the inside, the moon appearing through it was surrounded with a large and variously coloured halo; and, opening the window, he found that it arose entirely from that thin plate of ice, for none was seen except through it.

Similar, in some respects, to the halo, was the remarkable appearance which M. Bouguer describes, as observed by himself and his companions, on the top of Mount Pichinca, in the Cordilleras. When the sun was just rising behind them, so as to appear white, each of them saw his own shadow projected upon it, and no other. The distance was such, that all the parts of the shadow were easily distinguishable, as the arms, the leg, and the head; but what surprised them most, was, that the head was adorned with a kind of glory, consisting of three or four small concentric crowns, of a very lively colour, each exhibiting all the varieties of the primary rainbow, and having the circle of red on the outside. The intervals between these circles continued equal, though the diameters of them all were constantly changing. The last of them was very faint, and, at a considerable distance was another great white circle, which surrounded the whole. As near as M. Bouguer could compute, the diameter of the first of these circles was about $5\frac{1}{2}$ degrees, that of the second 11, that of the third 17, and so on; but the diameter of the white circle was about 76 degrees. This phenomenon never appeared but in a cloud consisting of frozen particles, and never in drops of rain, like the rainbow. When the sun was not in the horizon, only part of the white circle was visible, as M. Bouguer frequently observed afterwards.

Similar also to this curious appearance, was one that was observed by Dr McFait in Scotland. This

gentleman observed a rainbow round his shadow in the mist, when he was upon an eminence above it. In this situation the whole country round seemed, as it were, buried under a vast deluge, and nothing but the tops of distant hills appeared here and there above the flood; so that a man would think of diving down into it with a kind of horror. In those upper regions the air, he says, is at that time very pure and agreeable to breath in. At another time he observed a double range of colours round his shadow in these circumstances. The colours of the outermost range were broad and very distinct, and every where about two feet distant from the shadow. Then there was a darkish interval, and after that another narrower range of colours, closely surrounding the shadow, which was very much contracted. This person seems to think that these ranges of colours are caused by the inflection of the rays of light, the same that occasioned the ring of light which surrounds the shadows of all bodies, observed by M. Maraldi, and this author*. But the prodigious variety with which these appearances are exhibited seems to shew that many of them do not result from the general laws of reflexion, refraction, or inflection, belonging to transparent substances of a large mass; but upon the alternate reflexion and transmission of the different kinds of rays, peculiar to substances reduced to the form of thin plates, or consisting of separate and very minute parts. But where the dimensions of the coronas are pretty constant, as in the usual and larger halo, which is about half the diameter of the rainbow, they may, perhaps, be explained on the general principles of refraction only.

Descartes observes, that the halo never appears when it rains: from which he concludes that this phenomenon is occasioned by the refraction of light in the round particles of ice, which are then floating in the atmosphere; and though these particles are flat when they fall to the ground, he thought they must be protuberant in the middle, before their descent; and according to this protuberance he imagined that the diameter of the halo would vary.—In treating of meteors, Gassendi supposed that a halo is the same thing with the rainbow, the rays of light being in both cases twice refracted and once reflected within each drop of rain or vapour, and that all the difference there is between them arises from their different situation with respect to the observer. For, whereas, when the sun is behind the spectator, and consequently the rainbow before him, his eye is in the centre of the circle; when he views the halo, with his face towards the sun, his eye is in the circumference of the circle; so that, according to the known principles of geometry, the angle under which the object appears in this case, must be just half of what it is in the other. Though this writer lays a great deal upon the subject, and endeavours to give reasons why the colours of the halo are in a different order to those of the rainbow, he does not describe the progress of the rays of light from the sun to the eye of the spectator when a halo is formed by them, and he gives no figures to explain his ideas.

Dechales, also, endeavours to show that the generation of the halo is similar to that of the rainbow. If, says he, a sphere of glass or crystal, AB, full of water,

water, be placed in the beams of the sun shining from C, there will not only be two circles of coloured light, on the side next the sun, and which constitute the two rainbows; but there will also be another on the opposite to the sun, the rays belonging to which meeting at E, afterwards diverge, and form the coloured circle G, as will be visible, if the light that is transmitted through the globe be received on a piece of white paper. The colours also will appear to an eye placed in any part of the surface of the cone FEG. Measuring the angle FEH, he found it to be 23 degrees. They were only the extreme rays of this cone that were coloured like those of the rainbow.

This experiment he thought sufficiently illustrated the generation of the halo; so that whenever the texture of the clouds is such, as not entirely to intercept the rays of the sun or moon, and yet have some degree of density, there will always be an halo round them, the colours of the rainbow appearing in those drops which are 23 degrees distant from the sun or moon. If the sun be at A, and the spectator in B, the halo will be the circle DFE, DBE being 46 degrees, or twice 23.

The reason why the colours of the halo are more dilute than those of the rainbow, he says, is owing principally to their being formed not in large drops of rain, but in very small vapour; for if the drops of water were large, the cloud would be so thick, that the rays of the sun could not be regularly transmitted through them; and, on the other hand, he had observed, that when the rainbow is formed by very thin vapours, the colours hardly appear. As for those circles of colours which are sometimes seen round candles, it was his opinion that they are owing to nothing but moisture on the eye of the observer; for that he could never produce this appearance by means of vapour only, if he wiped his eyes carefully; and he had observed that such circles are visible to some persons and not to others, and to the same persons at one time and not another.

The most considerable of all the theories respecting halos, and that which has met with most favourable and the longest reception, is that of Mr Huygens. Sir Isaac Newton mentions it with respect, and Dr Smith, in his Complete system of Optics, does not so much as hint at any other. The occasion of M. Huygens publishing his thoughts on this subject, was the appearance of a halo at Paris, on the 12th of May 1667, of which he gave an account in a paper read at the Royal Academy in that city, which was afterwards translated, and published in the English Philosophical transactions, and which may be seen in Lowthorp's Abridgment, Vol. 2, p. 189. But this article contains nothing more than the heads of a discourse, which he afterwards composed, but never quite finished, on this subject; and which has been translated, with some additions, by Dr Smith, from whom the following account is chiefly extracted.

Our philosopher had been first engaged to think particularly upon this subject, by the appearance of five suns at Warfaw, in 1658; presently after which, he says, he hit upon the true cause of halos, and not long after of that of mock suns also.

To prepare the way for the following observations,

Corona-

it must be remarked, that if we can conceive any kind of bodies in the atmosphere, which, according to the known laws of optics, will, either by means of reflection or refraction, produce the appearance in question, when nothing else can be found that will do it, we must acquiesce in the hypothesis, and suppose such bodies to exist, even though we cannot give a satisfactory account of their generation. Now, two such bodies are affirmed by Mr Huygens; one of them a round ball, opaque in the centre, but covered with a transparent shell; and the other is a cylinder, of a similar composition. By the help of the former he endeavours to account for halos, and by the latter for those appearances which are called mock suns. Those bodies which Mr Huygens requires, in order to explain these phenomena, are not, however, a mere assumption; for some such, though of a larger size than his purpose requires, have been actually found, consisting of snow within, and ice without. They are particularly mentioned by Descartes.

The balls with the opaque kernel, which he supposed to have been the cause of them, he imagines not to exceed the size of a turnip-seed; but, in order to illustrate this hypothesis, he gives a figure of one, of a larger size, in ABCD, EF, representing the kernel of snow in the middle of it. If the rays of light, coming from GH, fall upon the side AD, it is manifest they will be so refracted at A and D, as to bend inwards; and many of them will strike upon the kernel EF. Others, however, as GA, and HD, will only touch the sides of the kernel; and being again refracted at B and C, will emerge in the lines BK, CK, crossing each other in the point K, whose nearest distance from the globe is somewhat less than its apparent diameter. If, therefore, BK and CK be produced towards M and L, (fig. 1. n° 4.) it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone represented by it.

For the same reason, every other of these globules will have a shadow behind it, in which the light of the sun will not be perceived. If the eye be at N, and that be conceived to be the vertex of a cone, the sides of which NR, NQ, are parallel to the sides of the former cone KL, KM, it is evident that none of the globules within the cone QNR, can send any rays of the sun to the eye at N. But any other globe out of this cone, as X, may send those rays, which are more refracted than XZ, to the eye; so that this will appear enlightened, while those within the cone will appear obscure. It is evident from this, that a certain area, or space, quite round the sun, must appear dark; and that the space next to this area will appear luminous, and more so in those parts that are nearest to the obscure area; because, he says, it may easily be demonstrated, that those globules which are nearest to the cone QNR exhibit the largest image of the sun. It is plain, also, that a corona ought to be produced in the same manner, whatever be the sun's altitude, because of the spherical figure of the globules.

To verify this hypothesis, our philosopher advises us to expose to the sun a thin glass bubble, filled with water, and having some opaque substance in the centre of it; and he says we shall find, that we shall not be

Fig. 1. n° 3.

be able to see the sun through it, unless at a certain distance from a place opposite to the centre of it; but as soon as we do perceive the light, the image of the sun will immediately appear the brightest, and coloured red, for the same reason as in the rainbow.

These coronas, he says, often appear about the moon; but the colours are so weak as to appear only white. Such white coronas he had also seen about the sun, when the space within them appeared scarce darker than that without. This he supposes to happen when there are but few of those globules in the atmosphere: for the more plentiful they are, the more lively the colours of the halo appear; at the same time also the area within the corona will be the darker. The apparent diameter of the corona, which is generally about 45 degrees, depends upon the size of the dark kernel; for the larger it is with respect to the whole globe, the larger will be the dark cone behind it.

The globules that form these halos, Mr Huygens supposes to have consisted of soft snow, and to have been rounded by continual agitation in the air, and thawed on their outsides by the heat of the sun.

To make the diameter of the halo 45 degrees, he demonstrates that the semi-diameter of the globe must be to the semi-diameter of the kernel of snow very nearly as 1000 to 480; and that to make a corona of 100 degrees, it must be as a 1000 to 680.

Mr Weidler, in his Commentary on parhelia, published at Wirtemburg in 1738, observes that it is very improbable that such globules as Mr Huygens' hypothesis requires, with nuclei of such a precise proportion, should exist; and if there were such bodies, he thinks they would be too small to produce the effects ascribed to them. Besides, he observes that appearances exactly similar to halos are not uncommon, where fluid vapours alone are concerned; as when a candle is placed behind the steam of boiling water in frosty weather, or in the midst of the vapour issuing copiously from a bath, or behind a receiver, when the air is so much rarefied as to be incapable of supporting the water it contains. The rays of the sun twice reflected and twice refracted within small drops of water are sufficient, he says, without any opaque kernel, to produce all the appearances of the halos that have the red light towards the sun, as may be proved by experiment. That the diameter of the halo is generally half of that of the rainbow, he accounts for as Cassendi did before him.

M. Mariotte accounts for the formation of the small coronas by the transmissiion of light through aqueous vapours, where it suffers two refractions, without any intermediate reflection. He shews that light which comes to the eye, after being refracted in this manner, will be chiefly that which falls upon the drop nearly perpendicular; because more rays fall upon any given quantity of surface in that situation, fewer of them are reflected with small degrees of obliquity, and they are not so much scattered after refraction. The red will always be outermost in these coronas, as consisting of rays which suffer the least refraction. And whereas he had seen, when the clouds were driven briskly by the wind, halos round the moon, varying frequently in their diameter, being sometimes of

two, sometimes of three, and sometimes of four degrees; sometimes also being coloured, sometimes only white, and sometimes disappearing intirely; he concluded that all these variations arose from the different thickness of the clouds, through which sometimes more and sometimes less light was transmitted. He supposed, also, that the light which formed them might sometimes be reflected, and at other times refracted. As to those coronas which consist of two orders of colours, he imagined that they were produced by small pieces of snow, which when they begin to dissolve, form figures which are a little convex towards their extremities. Sometimes, also, the snow will be melted in different shapes; and in this case, the colours of several halos will be intermixed, and confused; and such, he says, he had sometimes observed round the sun.

M. Mariotte then proceeds to explain the larger coronas, namely those that are about 45 degrees in diameter, and for this purpose he has recourse to equiangular prisms of ice, in a certain position with respect to the sun; and he takes pains to trace the progress of the rays of light for this purpose: but this hypothesis is very improbable. In some cases he thought that these large coronas were caused by hail-stones, of a pyramidal figure; because, after two or three of them had been seen about the sun, there fell the same day several such pyramidal hail-stones. M. Mariotte explains parhelia by the help of the same suppositions. See PARHELIA.

Sir Isaac Newton does not appear to have given any particular attention to the subject of halos, but he has hinted at his sentiments concerning them occasionally; by which we perceive that he considered the larger and less variable appearances of this kind as produced according to the common laws of refraction, but that the less and more variable appearances depend upon the same cause with the colours of thin plates.

He concludes his explication of the rainbow with the following observation on halos and parhelia. "The light which comes through drops of rain by two refractions, without any reflexion, ought to appear the strongest at the distance of about 26 degrees from the sun, and to decay gradually both ways as the distance from him increases. And the same is to be understood of light transmitted through spherical hail-stones: and if the hail be a little flatted, as it often is, the transmitted light may be so strong, at a little less distance than that of 26 degrees, as to form a halo about the sun or moon; which halo, as often as the hail-stones are duly figured, may be coloured, and then it must be red within by the least refrangible rays, and blue without by the most refrangible ones; especially if the hail-stones have opaque globules of snow in their centres to intercept the light within the halo, as Mr Huygens has observed, and make the inside of it more distinctly defined than it would otherways be. For such hail-stones, though spherical, by terminating the light by the snow, may make a halo red within, and colourless without, and darker within the red than without, as halos use to be. For of those rays which pass close by the snow, the red-making ones will be the least refracted, and so come to the eye in the straightest lines."

Some farther thoughts of Sir Isaac Newton's on the subject of halos we find subjoined to the account of his experiments on the colours of thick plates of glass, which he conceived to be similar to those which are exhibited by thin ones. "As light reflected by a lens quick-silvered on the back side makes the rings of the colours above described, so (he says), it ought to make the like rings in passing through a drop of water. At the first reflexion of the rays within the drop, some colours ought to be transmitted, as in the case of a lens, and others to be reflected back to the eye. For instance, if the diameter of a small drop or globule of water be about the 500th part of an inch, so that a red-making ray, in passing through the middle of this globule, has 250 fits of easy transmission within the globule, and all the red-making rays which are at a certain distance from this middle ray round about it have 249 fits within the globule, and all the like rays at a certain farther distance round about it have 248 fits, and all those at a certain farther distance 247 fits, and so on, these concentric circles of rays, after their transmission, falling on a white paper, will make concentric rings of red upon the paper; supposing the light which passes through one single globule strong enough to be sensible, and in like manner the rays of other colours will make rings of other colours. Suppose now that in a fair day the sun should shine through a thin cloud of such globules of water or hail, and that the globules are all of the same size, the sun seen through this cloud ought to appear surrounded with the like concentric rings of colours, and the diameter of the first ring of red should be $7\frac{1}{2}$ degrees, that of the second $10\frac{1}{2}$, that of the third $12^{\circ} 33'$, and according as the globules of water are bigger or less, the ring should be less or bigger."

This curious theory our author informs us was confirmed by an observation which he made in 1692. He saw by reflexion, in a vessel of stagnating vessel, three halos, crowns, or rings of colours about the sun, like three little rainbows concentric to his body. The colours of the first, or innermost crown, were blue next the sun, red without, and white in the middle, between the blue and red. Those of the second crown were purple and blue within, and pale red without, and green in the middle. And those of the third were pale blue within, and pale red without. These crowns inclosed one another immediately, so that their colours proceeded in this continual order from the sun outward; blue, white, red; purple, blue, green, pale yellow, and red; pale blue, pale red. The diameter of the second crown, measured from the middle of the yellow and red on one side of the sun, to the middle of the same colour on the other side, was $9\frac{1}{2}$ degrees, or thereabouts. The diameters of the first and third he had not time to measure; but that of the first seemed to be about five or six degrees, and that of the third about twelve. The like crowns appear sometimes about the moon. For in the beginning of the year 1664, on February 19th at night, he saw two such crowns about her. The diameter of the first, or innermost, was about three degrees, and that of the second about five degrees and a half. Next about the moon was a circle of white; and next about that the inner crown, which was of a bluish green within,

next the white, and of a yellow and red without; and next about these colours were blue and green on the inside of the outer crown, and red on the outside of it.

At the same time there appeared a halo at the distance of about $22^{\circ} 35'$ from the centre of the moon. It was elliptical; and its long diameter was perpendicular to the horizon, verging below farthest from the moon. He was told that the moon has sometimes three or more concentric crowns of colours encompassing one another next about her body. The more equal the globules of water or ice are to one another, the more crowns of colours will appear, and the colours will be the more lively. The halo, at the distance of $22\frac{1}{2}$ degrees from the moon, is of another sort. By its being oval, and more remote from the moon below than above, he concludes that it was made by refraction in some kind of hail or snow floating in the air in an horizontal posture, the refracting angle being about 50 or 60 degrees. Dr Smith, however, makes it sufficiently evident, that the reason why this halo appeared oval, and more remote from the moon towards the horizon, is a deception of sight, and the same with that which makes the moon appear larger in the horizon.

Dr Kotelnihow, having, like Dr Halley, made very accurate observations to determine the number of possible rainbows, considered the coloured halo which appears about a candle as the same thing with one of these bows which is formed near the body of the sun, but which is not visible on account of his excessive splendor.

Lastly, M. Muschenbroeck concludes his account of coronas with observing, that some density of vapour, or some thickness of the plates of ice, divides the light in its transmission through the small globules of water, or their interstices, into its separate colours: but what that density was, or what was the size of the particles which composed the vapour, he could not pretend to determine.

CORONA, among botanists, the name given by some to the circumference or margin of a radiated compound flower. It corresponds to the *radius* of Linnæus; and is exemplified in the flat, tongue-shaped petals which occupy the margin of the daisy or sun-flower.

CORONA Borealis, the northern crown, or garland, in astronomy, a constellation of the northern hemisphere, whose stars in Ptolemy's catalogue are eight, in Tycho's as many, and in Mr Flamsteed's 21.

CORONA Imperialis, in conchology, a name given by some authors to a kind of *voluta*, differing from the other shells of that family, by having its head ornamented with a number of points, forming a sort of crown. See *VOLUTA*.

CORONA Imperialis, in botany. See *FRITILLARIA*.

CORONA Solis, in botany. See *HELIANTHUS*.

CORONAL, in anatomy, the first suture of the skull. See *ANATOMY*, n^o 10, g.

CORONALE os, the same with the *os frontis*. See *ANATOMY*, n^o 11.

CORONARY VESSELS, in anatomy, certain vessels which furnish the substance of the heart with blood.

CORONARY Arteries, are two arteries springing out of

Coronary

of the aorta, before it leaves the pericardium. See ANATOMY, n° 387, b. and 386, d.

CORONARY *Vein*, a vein diffused over the exterior surface of the heart. *Ibid.* n° 386, d.

Stomachic CORONARY, a vein inserted into the trunk of the splenic vein, which, by uniting with the mesenteric, forms the vena porta. See ANATOMY, n° 387, k.

CORONARIÆ, in botany, the 10th order of plants in Linnæus's Fragments of a natural method. Under this name, instead of the more obvious one *libaceæ*, Linnæus collects a great number of genera, most of which furnish very beautiful garden-flowers, viz. albuca, cyanella, fritillaria, helonias, hyacinthus, hypoxis, lilium, melanthium, ornithogalum, scilla, tulipa, agave, aletris, aloe, anthericum, aphodelus, bromelia, burmannia, hemerocallis, polianthes, tilandisia, veratrum, yucca.

CORONELLI (Vincent), a famous geographer, born at Venice. His skill in the mathematics having brought him to the knowledge of the count d'Elstrees, his eminence employed him in making globes for Lewis XIV. With this view Coronelli spent some time at Paris; and left a great number of globes there, which are esteemed. In 1685, he was made cosmographer to the republic of Venice; and four years after, public professor of geography. He founded an academy of cosmography at Venice; and died in that city in 1718. He published above 400 geographical charts, an abridgement of cosmography, several books on geography, and other works.

CORONER, (*coronator*) an ancient officer in England, so called because he hath principally to do with pleas of the crown, or such wherein the king is more immediately concerned. And in this light, the lord chief justice of the king's bench is the principal coroner in the kingdom; and may, if he pleases, exercise the jurisdiction of a coroner in any part of the realm. But there are also particular coroners for every county of England; usually four, but sometimes six, and sometimes fewer. This officer is of equal authority with the sheriff; and was ordained, together with him, to keep the peace when the earls gave up the wardship of the county.

He is chosen by all the freeholders of the county court; and by the statute of Westminster 1. it was enacted, that none but lawful and discreet knights should be chosen; but it seems now sufficient if a man have lands enough to be made a knight, whether he be really knighted or not: for the coroner ought to have an estate sufficient to maintain the dignity of his office, and answer any fines that may be made upon him for his misbehaviour; and, if he hath not enough to answer, his fine shall be levied on the county, as a punishment for electing an insufficient officer. Now, indeed, through the culpable neglect of gentlemen of property, this office has been suffered to fall into disrepute, and get into low and indigent hands: so that although formerly no coroners would be paid for serving their country, and they were by the aforesaid statute of Westminster 1. expressly forbidden to take a reward under pain of great forfeiture to the king; yet for many years past they have only desired to be chosen for the sake of their perquisites; being allow-

ed fees for their attendance by the statute 3 Hen. VII. c. 1. which Sir Edward Coke complains of heavily, though since his time those fees have been much enlarged.

The coroner is chosen for life; but may be removed, either by being made sheriff, or chosen *verderer*, which are offices incompatible with the coroner; and by the statute 25 Geo. II. c. 29. extortion, neglect, or misbehaviour, are also made causes of removal.

The office and power of a coroner are also, like those of the sheriff, either judicial or ministerial; but principally judicial. This is in great measure ascertained by statute 4 Edw. I. *De officio coronatoris*; and consists, first, in inquiring, when any person is slain, or dies suddenly, or in prison, concerning the manner of his death. And this must be *super vium corporis*; for if the body is not found, the coroner cannot sit. He must also sit at the very place where the death happened. And his inquiry is made by a jury from four, five, or six of the neighbouring towns, over whom he is to preside. If any be found guilty by this inquest of murder, he is to commit to prison for farther trial, and is also to inquire concerning their lands, goods, and chattels, which are forfeited thereby; but whether it be murder or not, he must inquire whether any dead and has accrued to the king, or the lord of the franchise, by this death; and must certify the whole of this inquisition to the court of king's bench, or the next assizes. Another branch of his office is to inquire concerning shipwrecks; and certify whether wreck or not, and who is in possession of the goods. Concerning treasure-trove, he is also to inquire concerning the finders, and where it is, and whether any one be suspected of having found and concealed a treasure; "and that may well be perceived, (saith the old statute of Edw. I.) where one liveth riotously, haunting taverns, and hath done so of long time;" whereupon he might be attached and held to bail upon this suspicion only.

The ministerial office of the coroner is only as the sheriff's substitute. For when just exception can be taken to the sheriff, for suspicion of partiality, (as that he is interested in the suit, or of kindred to either plaintiff or defendant), the process must then be awarded to the coroner, instead of the sheriff, for execution of the king's writs.

CORONET. See CROWN.

CORONET, or *Crown*, of a *Horse*, the lowest part of the paltrim, which runs round the coffin, and is distinguished by the hair joining and covering the upper part of the hoof.

CORONILLA, *jointed podded* COLUTEA; a genus of the decandria order, belonging to the diadelphia class of plants. To this genus Linnæus also joins the *emerus*, or *Scorpion fena*; though Mr Miller makes it a distinct species. There are 11 species, all of them plants of considerable beauty, with very bright yellow flowers. All of them, however, are rather too tender for this climate, except the *emerus*. This species rises with a shrubby stem, branching numerously six or eight feet high, closely garnished with winged leaves of three pair of lobes, terminated by an odd one; and, at the sides of the branches, numerous long flower-stalks, each supporting two or three large yellow flowers.

Coronet
|

Coromoid
Corpora-
tion.

flowers of the papilionaceous kind, succeeded by longish pods; it is easily propagated by seeds, and likewise by layers, or cuttings. The leaves of this plant are esteemed laxative, and used as a substitute for common fena in some parts of Europe. A dye is procured by fermentation from the leaves, like that of indigo.

CORONOID, and CONDYLROID, *Proceffes*. See ANATOMY, n^o 256.

CORPORAL, an inferior officer under a serjeant, in a company of foot, who has charge over one of the divisions, places and relieves sentinels, and keeps good order in the corps de garde: he also receives the word from the inferior rounds, which passes by his corps de garde. This officer carries a fusée, and is commonly an old soldier: there are generally three corporals in each company.

CORPORAL of a *Ship of War*, an officer under the master at arms, employed to teach the officers the exercise of small arms, or of musketry; to attend at the gang-way, or entering ports, and observe that no spirituous liquors are brought into the ship, unless by express leave from the officers. He is also to extinguish the fire and candles at eight o'clock in winter, and nine in summer, when the evening gun is fired; and to walk frequently down in the lower decks in his watch, to see that there are no lights but such as are under the charge of proper centinels.

CORPORATION, a body politic or incorporate, so called, because the persons or members are joined into one body, and are qualified to take, grant, &c.

Of corporations there is a great variety subsisting, for the advancement of religion, of learning, and of commerce; in order to preserve entire and for ever those rights and immunities, which, if they were granted only to those individuals of which the body corporate is composed, would upon their death be utterly lost and extinct. To shew the advantages of these incorporations, let us consider the case of a college in either of our universities, founded *ad studendum et orandum*, for the encouragement and support of religion and learning. If this was a mere voluntary assembly, the individuals which compose it might indeed read, pray, study, and perform scholastic exercises together, so long as they could agree to do so: but they could neither frame, nor receive, any laws or rules of their conduct; none at least which would have any binding force, for want of a coercive power to create a sufficient obligation. Neither could they be capable of retaining any privileges or immunities: for, if such privileges be attacked, which of all this unconnected assembly has the right or ability to defend them? And, when they are dispersed by death or otherwise, how shall they transfer these advantages to another set of students, equally unconnected as themselves? So also, with regard to holding estates or other property, if land be granted for the purposes of religion or learning to 20 individuals not incorporated, there is no legal way of continuing the property to any other persons for the same purposes, but by endless conveyances from one to the other, as often as the hands are changed. But when they are consolidated and united into a corporation, they and their successors are then considered as one person in law: as one person, they have one will, which is col-

lected from the sense of the majority of the individuals: this one will may establish rules and orders for the regulation of the whole, which are a sort of municipal laws of this little republic; or rules and statutes may be prescribed to it at its creation, which are then in the place of natural laws: the privileges and immunities, the estates and possessions, of the corporation, when once vested in them, will be for ever vested, without any new conveyance to new successors; for all the individual members that have existed from the foundation to the present time, or that shall ever hereafter exist, are but one person in law, a person that never dies: in like manner as the river Thames is still the same river, though the parts which compose it are changing every instant.

The honour of originally inventing these political constitutions entirely belongs to the Romans. They were introduced, as Plutarch says, by Numa; who finding, upon his accession, the city torn to pieces by the two rival factions of Sabines and Romans, thought it a prudent and politic measure to subdivide these two into many smaller ones, by instituting separate societies of every manual trade and profession. They were afterwards much considered by the civil law, in which they were called *universitates*, as forming one whole out of many individuals; or *collegia*, from being gathered together: they were adopted also by the canon law, for the maintenance of ecclesiastical discipline; and from them our spiritual corporations are derived. But our laws have considerably refined and improved upon the invention, according to the usual genius of the English nation: particularly with regard to sole corporations, consisting of one person only, of which the Roman lawyers had no notion; their maxim being, that "*tres faciunt collegium*;" though they held, that if a corporation, originally consisting of three persons, be reduced to one, "*si universitas ad unum redit*," it may still subsist as a corporation, "*et flet nomen universitatis*."

As to the several sorts of corporations, the first division of them is into *aggregate* and *sole*. Corporations AGGREGATE consist of many persons united together into one society, and are kept up by a perpetual succession of members, so as to continue for ever: of which kind are the mayor and commonalty of a city, the head and fellows of a college, the dean and chapter of a cathedral church. Corporations SOLE consist of one person only and his successors, in some particular station, who are incorporated by law, in order to give them some legal capacities and advantages, particularly that of perpetuity, which in their natural persons they could not have had. In this sense the king is a sole corporation: so is a bishop: so are some deans and prebendaries, distinct from their several chapters: and so is every parson and vicar. And the necessity, or at least use, of this institution will be very apparent, if we consider the case of a parson of a church. At the original endowment of parish-churches, the freehold of the church, the church-yard, the parsonage-house, the glebe, and the tithes of the parish, were vested in the then parson by the bounty of the donor, as a temporal recompence to him for his spiritual care of the inhabitants, and with intent that the same emoluments should ever afterwards continue as a recom-

Corpora-
tion.

Blackst.
Comment.

Corpora-
tion.Corpora-
tion.Blackst.
Comment.Blackst.
Comment.

pence for the same care. But how was this to be effected? The freehold was vested in the parson; and, if we suppose it vested in his natural capacity, on his death it might descend to his heir, and would be liable to his debts and incumbrances: or at best the heir might be compellable, at some trouble and expence, to convey these rights to the succeeding incumbent. The law therefore has wisely ordained, that the parson, *quatenus* parson, shall never die, any more than the king; by making him and his successors a corporation. By which means all the original rights of the parsonage are preserved entire to the successor: for the present incumbent, and his predecessor who lived seven centuries ago, are in law one and the same person; and what was given to the one was given to the other also.

Another division of corporations, either sole or aggregate, is into *ecclesiastical* and *lay*. ECCLESIASTICAL corporations are where the members that compose it are entirely spiritual persons; such as bishops; certain deans and prebendaries; all archdeacons, parsons, and vicars; which are sole corporations: deans and chapters at present, and formerly prior and convent, abbot and monks, and the like, bodies aggregate. These are erected for the furtherance of religion, and perpetuating the rights of the church.—*LAY* corporations are of two sorts, *civil* and *elemosynary*. The *civil* are such as are erected for a variety of temporal purposes. The king, for instance, is made a corporation to prevent in general the possibility of an *interregnum* or vacancy of the throne, and to preserve the possessions of the crown entire; for, immediately upon the demise of one king, his successor is in full possession of the regal rights and dignity. Other lay corporations are erected for the good government of a town or particular district, as a mayor and commonalty, bailiff and burgesses, or the like: some for the advancement and regulation of manufactures and commerce; as the trading companies of London, and other towns: and some for the better carrying on of divers special purposes; as church-wardens, for conservation of the goods of the parish; the college of physicians and company of surgeons in London, for the improvement of the medical science; the royal society for the advancement of natural knowledge; and the society of antiquarians for promoting the study of antiquities. The *elemosynary* sort are such as are constituted for the perpetual distribution of the free aims, or bounty, of the founder of them to such persons as he has directed. Of this kind are all hospitals for the maintenance of the poor, sick, and impotent; and all colleges, both *in our universities* and *out of them*: which colleges are founded for two purposes; 1. For the promotion of piety and learning by proper regulations and ordinances. 2. For imparting assistance to the members of those bodies, in order to enable them to prosecute their devotion and studies with greater ease and assiduity. And all these elemosynary corporations are, strictly speaking, lay, and not ecclesiastical, even though composed of ecclesiastical persons,

and although they in some things partake of the nature, privileges, and restrictions of ecclesiastical bodies.

Having thus marshalled the several species of corporations, let us next proceed to consider, 1. How corporations in general may be created. 2. What are their powers, capacities, and incapacities. And, 3. How they may be dissolved.

1. Corporations, by the civil law, seem to have been created by the mere act, and voluntary association, of their members; provided such convention was not contrary to law, for then it was *illicitum collegium*. It does not appear that the prince's consent was necessary to be actually given to the foundation of them; but merely that the original founders of these voluntary and friendly societies (for they were little more than such) should not establish any meetings in opposition to the laws of the state.

But in England the king's consent is absolutely necessary to the erection of any corporation, either impliedly or expressly given (A). The king's implied consent is to be found in corporations which exist by force of the common law, to which our former kings are supposed to have given their concurrence; common law being nothing else but custom, arising from the universal agreement of the whole community. Of this sort are the king himself, all bishops, parsons, vicars, churchwardens, and some others; who by common law have ever been held (as far as our books can shew us) to have been corporations, *virtute officii*: and this incorporation is so inseparably annexed to their offices, that we cannot frame a complete legal idea of any of these persons, but we must also have an idea of a corporation, capable to transmit his rights to his successors, at the same time. Another method of implication, whereby the king's consent is presumed, is as to all corporations by prescription, such as the city of London, and many others, which have existed as corporations, time whereof the memory of man runneth not to the contrary; and therefore are looked upon in law to be well created. For though the members thereof can shew no legal charter of incorporation, yet in cases of such high antiquity the law presumes there once was one; and that by the variety of accidents, which a length of time may produce, the charter is lost or destroyed. The methods by which the king's consent is expressly given, are either by act of parliament or charter. By act of parliament, of which the royal assent is a necessary ingredient, corporations may undoubtedly be created: but it is observable, that most of those statutes, which are usually cited as having created corporations, do either confirm such as have been before created by the king; as in the case of the college of physicians, erected by charter to Hen. VIII. which charter was afterwards confirmed in parliament; or, they permit the king to erect a corporation *in futuro* with such and such powers; as is the case of the bank of England, and the society of the British fishery. So that the immediate creative act is usually performed by the king alone, in virtue of his royal prerogative.

All

(A) Cities and towns were first erected into corporate communities on the continent, and endowed with many valuable privileges, about the 11th century, (Robert. Cha. V. i. 32.); to which the consent of the feudal sovereign was absolutely necessary, as many of his prerogatives and revenues were thereby considerably diminished.

Corpora-
tion.

All the other methods therefore whereby corporations exist, by common law, by prescription, and by act of parliament, are for the most part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words "creamus, erigimus, fundamus, incorporamus," or the like. Nay it is held, that if the king grants to a set of men to have *gildam mercatoriam*, "a mercantile meeting or assembly," this is alone sufficient to incorporate and establish them for ever.

Instit.

The king (it is said) may grant to a subject the power of erecting corporations, though the contrary was formerly held: that is, he may permit the subject to name the persons and powers of the corporation at his pleasure; but it is really the king that erects, and the subject is but the instrument: for though none but the king can make a corporation, yet *qui facit per alium, facit per se*. In this manner the chancellor of the university of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of several matriculated companies, now subsisting, of tradesmen subservient to the students.

When a corporation is erected, a name must be given to it; and by that name alone it must sue, and be sued, and do all legal acts.

II. After a corporation is so formed and named, it acquires many powers and rights, which we are next to consider. Some of these are necessarily and inseparably incident to every corporation; which incidents, as soon as a corporation is duly erected, are tacitly annexed of course. As, 1. To have perpetual succession. This is the very end of its incorporation: for there cannot be a succession for ever without an incorporation; and therefore all aggregate corporations have a power necessarily implied of electing members in the room of such as go off. 2. To sue or be sued, implead or be impleaded, grant or receive, by its corporate name, and do all other acts as natural persons may. 3. To purchase lands, and hold them, for the benefit of themselves and their successors: which two are consequential to the former. 4. To have a common seal. For a corporation, being an invisible body, cannot manifest its intentions by any personal act or oral discourse: it therefore acts and speaks only by its common seal. For, though the particular members may express their private consents to any act, by words, or signing their names, yet this does not bind the corporation; it is the fixing of the seal, and that only, which unites the several assents of the individuals, who compose the community, and makes one joint assent of the whole. 5. To make by-laws or private statutes for the better government of the corporation; which are binding upon themselves, unless contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws, which may affect the king's prerogative, or the common profit of the people, under penalty of 40 l. unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits: and, even though they be so approved, still if contrary to law they are void. These five powers are inseparably incident to every corporation, at least to every corporation *aggregate*:

for two of them, though they may be practised, yet are very unnecessary to a corporation *sole*; viz. to have a corporate seal to testify his sole assent, and to make statutes for the regulation of his own conduct.

Corpora-
tion.

Corporations have a capacity to purchase lands for themselves and successors; but they are excepted out of the statute of wills; so that no devise of lands to a corporation by will is good; except for charitable uses, by statute 43 Eliz. c. 4. which exception is again greatly narrowed by the statute 9 Geo. II. c. 36. And also, by a great variety of statutes, their privilege even of purchasing from any living grantor, is much abridged; so that now a corporation, either ecclesiastical or lay, must have a licence from the king to purchase, before they can exert that capacity which is vested in them by the common law: nor is even this in all cases sufficient. These statutes are generally called the statutes of mortmain. See MORTMAIN.

Black?

The general duties of all bodies politic, considered in their corporate capacity, may, like those of natural persons, be reduced to this single one; that of acting up to the end or design, whatever it be, for which they were created by their founder.

III. How corporations may be dissolved. Any particular member may be disfranchised, or lose his place in the corporation, by acting contrary to the laws of the society, or the laws of the land: or he may resign it by his own voluntary act. But the body politic may also itself be dissolved in several ways; which dissolution is the civil death of the corporation: and in this case their lands and tenements shall revert to the person, or his heirs, who granted them to the corporation: for the law doth annex a condition to every such grant, that if the corporation be dissolved, the grantor shall have the lands again, because the cause of the grant faileth. The grant is indeed only during the life of the corporation; which may endure for ever: but, when that life is determined by the dissolution of the body politic, the grantor takes it back by reversion, as in the case of every other grant for life. The debts of a corporation, either to or from it, are totally extinguished by its dissolution; so that the members thereof cannot recover, or be charged with them, in their natural capacities: agreeable to that maxim of the civil law, "*si quid universitati debetur, singulis non debetur; nec, quod debet universitati, singuli debent.*"

A corporation may be dissolved, 1. By act of parliament, which is boundless in its operations. 2. By the natural death of all its members, in cases of an aggregate corporation. 3. By surrender of its franchises into the hands of the king, which is a kind of suicide. 4. By forfeiture of its charter, through negligence or abuse of its franchises; in which case the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular course is to bring an information in nature of a writ of *quo warranto*, to inquire by what warrant the members now exercise their corporate power, having forfeited it by such and such proceedings. The exertion of this kind of law, for the purposes of the state, in the reigns of king Charles and king James II. particularly by seizing the charter of the city of London, gave great and just of-

Corporal
Corporcular

Corradini
Corrosion

sence; and though perhaps, in strictness of law, the proceedings in most of them were sufficiently regular: but the judgment against that of London was reversed by act of parliament after the revolution; and by the same statute it is enacted, that the franchises of the city of London shall never more be forfeited for any cause whatsoever. And, because by the common law corporations were dissolved, in case the mayor or head officer was not duly elected on the day appointed in the charter or established by prescription, it is now provided, that for the future no corporation shall be dissolved upon that account; and ample directions are given for appointing a new officer, in case there be no election, or a void one, made upon the charter or prescriptive day.

CORPOREAL, those qualities which denominate a body. See **QUALITY, BODY, and INCORPOREAL**.

CORPSE, a dead body.

If any one, in taking up a dead body, steals the shroud, or other apparel, it will be felony. Stealing only the corpse itself is not felony; but it is punishable as a misdemeanor by indictment at common law.

CORPULENCY, the state of a person too much loaded with flesh or fat.—For the causes and cure of *corpulency*, (see the *Index* subjoined to) **MEDICINE**.

CORPUS, in anatomy, is applied to several parts of the animal structure; as *corpus callosum*, *corpus cavernosum*, &c. See **ANATOMY**, n° 371, o, p. and 372, c.

CORPUS, is also used in matters of learning, for several works of the same nature collected and bound together.

Gratian made a collection of the canons of the church, called *corpus canonum*. The *corpus* of the civil law is composed of the digest, code, and institutes. We have also a *corpus* of the Greek poets; and another of the Latin poets.

CORPUS CHRISII, a festival of the church of England, kept on the next Thursday after Trinity-sunday, instituted in honour of the eucharist; to which also one of the colleges in Oxford is dedicated.

CORPUSCULE, in physics, a minute particle, or physical atom, being such as a natural body is made up of. By this word is not meant the elementary particles, nor the hypothetical principles of chemists; but such particles, whether of a simple or compound nature, whose parts will not be dissolved nor dissipated by ordinary degrees of heat.

CORPUSCULAR PHILOSOPHY, that way of philosophizing which endeavours to explain things, and to account for the phenomena of nature, by the motion, figure, rest, position, &c. of the corpuscles, or the minute particles of matter.

Mr Boyle sums up the chief principles of the corpuscular hypothesis, which now flourishes under the mechanical philosophy, in these particulars:

1. They suppose that there is but one catholico or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies, and capable of all forms. 2. That this matter, in order to form the vast variety of natural bodies, must have motion in some or all its assignable parts; and that this motion was given to matter by God the Creator of all

things, and has all manner of directions and tendencies. 3. Matter must also be actually divided into parts, and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude or size, as also its peculiar figure or shape. 4. They suppose also, that these differently sized and shaped particles may have as different orders and positions, whereof great variety may arise in the composition of bodies.

CORRADINI de Sezza (Peter Marcellinus) a learned civilian and cardinal, born at Sezza, in 1658, acquired the esteem and confidence of Clement XI. and died at Rome in 1743. He was the author of a learned and curious work entitled “*Vetus Latium profanum & sacrum*,” 2 vols folio; and a history of Sezza, in 4^{to}.

CORRADO (Sebastian) an Italian grammarian of the 16th century, taught the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be professor of those languages. He wrote several works, the most esteemed of which are, “*Questura in qua Cicconis Vita refertur*,” an excellent performance; and, “*de Lingua Latina*.” He died in 1556.

CORRECTION, in printing, the pointing out or discovering the faults in a printed sheet, in order to be amended by the compositor before it be printed off. See **PRINTING**.

CORRECTOR, in general, denotes something that mends the faults or bad qualities of others.

CORRECTOR of the Staple, a clerk belonging to the staple, whose business is to write down and record the bargains that merchants make there.

CORRECTOR, in medicine or pharmacy, an ingredient in a composition, which guards against or abates the force of another.

CORREGGIO (Antonia da), a most extraordinary painter, named from a town in the duchy of Modena, where he was born in 1594. He was a man of such great natural talents, that nothing but the deficiencies of education prevented his being the best painter in the world. This artist is noted for borrowing nothing from the works of other men, and his novelties are clear from censure. He is said to be the first who placed figures in the air, or sky, of history-pieces; and to have excelled in the art of fore-shortening, and in “the magic of ceilings.” Correggio spent the greatest part of his life at Parma; where, notwithstanding his high reputation, he was obliged to work hard for the maintenance of a large family, and was extremely poor. He died young, in 1534, by an odd circumstance: he was to have 50 crowns for a piece of work; and receiving the sum in copper, which he had to carry 12 miles in the midst of summer, he overheated himself; and indiscreetly drinking cold water, brought on a plourisy that killed him.

CORRELATIVE, something opposed to another in a certain relation. Thus, father and son are correlatives. Light and darkness, motion and rest, are relative and opposite terms.

CORROBORANTS, or **CORROBORATIVE Medicines**. See **STRENGTHENERS**.

CORROSION, in a general sense, the action of gnawing

gnawing away, by degrees, the continuity of the parts of bodies.

CORROSION, in chemistry, an action of bodies, by means of proper menstruums, that produces new combinations, and a change of their form, without converting them to fluidity.

CORROSIVE, **SUBLIMATE MERCURY**. See **CHEMISTRY**, n° 351.

CORRUATOR MUSCLE. See **ANATOMY**, *Table of the Muscles*.

CORROSIVES, in surgery, are medicines which corrode whatever part of the body they are applied to: such are burnt alum, white precipitate of mercury, white vitriol, red precipitate of mercury, butter of antimony, lapis infernalis, &c.

CORRUPTION, the destruction, extinction, or, at least, cessation for a time, of the proper mode of existence of any natural body. See **PUTREFACTION**.

CORRUPTION of Blood, in law, one of the consequences of an attainder; and is both upwards and downwards; so that an attainted person can neither inherit lands or other hereditaments from his ancestors, nor retain those he is already in possession of, nor transmit them by descent to any heir; but the same shall escheat to the lord of the fee, subject to the king's superior right of forfeiture; and the person attainted shall also obstruct all descents to his posterity, wherever they are obliged to derive a title through him to a remoter ancestor. See **ATTAINDER**.

This is one of those notions which our laws have adopted from the feudal constitutions, at the time of the Norman conquest; as appears from its being unknown in those tenures which are indisputably Saxon, or Gavel kind; wherein, though by treason, according to the ancient Saxon laws, the land is forfeited to the king, yet no corruption of blood, no impediment of descents, ensues; and on judgment of mere felony, no escheat accrues to the lord. But, by the law of England, derived as above, a man's blood is so universally corrupted by attainder, that his sons can neither inherit to him nor to any other ancestor, at least on the part of their attainted father.

This corruption of blood cannot be absolutely removed but by authority of parliament. The king may excuse the public punishment of an offender; but cannot abolish the private right which has accrued, or may accrue, to individuals as a consequence of the criminal's attainder. He may remit a forfeiture in which the interest of the crown is alone concerned; but he cannot wipe away the corruption of blood; for therein a third person hath an interest, the lord who claims by escheat. If therefore a man hath a son, and is attainted, and afterwards pardoned by the king; this son can never inherit to his father, or father's ancestors; because his paternal blood, being once thoroughly corrupted by his father's attainder, must continue so; but if the son had been born after the pardon, he might inherit; because, by the pardon, the father is made a new man, and may convey new inheritable blood to his after-born children.

This corruption of blood, thus arising from feudal principles, but perhaps extended farther than even these principles will warrant, has been long looked upon as a peculiar hardship: because the oppressive

parts of the feudal tenures being now in general abolished, it seems unreasonable to reserve one of their most inequitable consequences, namely, that the children should not only be reduced to present poverty, (which, however severe, is sufficiently justified upon reasons of public policy), but also be laid under future difficulties of inheritance, on account of the guilt of their ancestors. And therefore in most (if not all) of the new felonies treated by Parliament since the reign of Henry VIII. it is declared that they shall not extend to any corruption of blood: and by the statute 7 Anne c. 21. (the operation of which is postponed by the statute 17 Geo. II. c. 39.) it is enacted, that, after the death of the late pretender and his sons, no attainer for treason shall extend to the disinheriting any heir, nor the prejudice of any person, other than the offender himself: which provisions have indeed carried the remedy farther than was required by the hardship above complained of; which is only the future obstruction of descents, where the pedigree happens to be deduced through the blood of an attainted ancestor.

CORSAIR, a pirate, or person who scours the sea for plunder, with an armed vessel, without commission from any prince or power. A corsair differs from a privateer, in that the latter acts under a commission, and only attacks the vessels of that state at war with the state whence he had his commission.

CORSELET, a little cuirass; or, according to others, an armour or coat made to cover the whole body, anciently worn by the pike-men, usually placed in the front and flanks of the battle, for the better resisting the enemy's assaults, and guarding the soldiers placed behind them.

CORSICA, an island in the Mediterranean, between 8° and 10° E. Long. and between 41° and 43° N. Lat. about 100 miles south of Genoa, and subject to that republic; though the natives for many years disputed their right. The island is now in the hands of the French.

CORSNED, or **MORSEL of EXECRATION**, a species of trial or purgation * anciently in use among us, and which probably arose from an abuse of revelation in the dark ages of superstition. It consisted of a piece of cheese or bread, about an ounce in weight, which was consecrated with a form of exorcism; desiring of the Almighty that it might cause convulsions and paleness, and find no passage, if the man was really guilty; but might turn to health and nourishment, if he was innocent; as the water of jealousy among the Jews was, by God's especial appointment, to cause the belly to swell, and the thigh to rot, if the woman was guilty of adultery. This corsned was then given to the suspected person, who at the same time also received the holy sacrament: if indeed the corsned was not, as some have suspected, the sacramental bread itself; till the subsequent invention of transubstantiation preserved it from profane uses with a more profound respect than formerly. Our historians assure us, that Godwin, earl of Kent, in the reign of king Edward the Confessor, abjuring the death of the king's brother, at last appealed to his corsned, "*per buccellum deglutendum abjuravit*," which stuck in his throat and killed him. This custom has been long since gradually abolished, though the remembrance of it still subsists in certain

Corsair

Cortex.

certain phrases of abjuration retained among the common people; as, "I will take the sacrament upon it; May this morfel be my last;" and the like.

CORT (Cornelius), one of the most celebrated engravers, and best designers Holland has produced, went to Rome in about the middle of the 16th century, and settled there. It was he who taught Auguftin Caracci to engrave.

CORTES of SPAIN, a term purely Spanish, fignifying the *courts*, i. e. the states, or assembly of the states, at Madrid.

CORTES, or CORTEZ, (Ferdinand), a Spanish general, famous for the conquest of Mexico, and other victories over the natives of South America; but infamous for the cruelties he committed upon the vanquished, without regard to rank, age, or sex. It probably was on this account he was but coolly received at his return to Europe, by his royal master Charles le Quint: it is even asserted that the emperor asked him who he was? to which Cortez replied; "I am the man who have given you more provinces than your ancestors have left you towns." Died in 1554, aged 63. See MEXICO.

CORTEX, in botany, the rind, or coarse outer BARK, of plants. The organization of the outer and inner barks, which differ principally in the fineness of their texture, is particularly explained under the article PLANTS.

Wounds of the bark, and its separations from the wood, whether naturally or artificially made, are easily cured, and made to unite again by proper care. If sections be made in the rinds of the ash and sycamore of a square figure, three sides cut, and the fourth uncut, and the whole be afterwards bound round with a pack-thread, it will all unite again, only leaving a scar in each of the three sides where it was cut. If several parts of the bark of either of these trees be cut off, and entirely separated from the tree; some shallower, leaving a part of the bark on; and others deeper, to the wood itself; these pieces being again put into their places, and bound on with pack-thread, will not indeed unite, but a fresh bark will grow in their places, and thrust them away: but if they be first carefully laid on in the exact direction in which they originally grew, and then the whole part beyond the wound on every side covered with a large plaster of diachylon, or the like, and this bound over with pack-thread to keep all firmly in their places, the pieces of bark, whether cut off shallower, or deep down to the very wood of the tree, will firmly unite themselves to the places where they originally grew. This cure will be performed in about three weeks: but the outer rind of the separated pieces will not be plump, but somewhat shivelled; the edges also will recede somewhat from their original place; so that there remains a sort of scar all round. These experiments are best made in the spring season; for, in the autumn and winter, the sap ariling but weakly, the parts that should unite wither before that is brought about. The success of these experiments has made some think that the whole branch of a tree separated and bound on again might unite with the rest. But the experiments that have been made in the most favourable manner for such a trial have all proved vain,

the branch cut off withering always in a few days, however well united, and carefully kept on.

CORTEX *Peruvianus*. See CINCHONA.

CORTEX *Winteranus*. See White CINNAMON.

CORTONA, a very ancient town of Italy, mentioned by many of the Roman historians. It was originally called *Corton*, and lay to the northward of the lake Thraflymenus. It still retains the name of Cortona. E. Long. 13. o. N. Lat. 43. 15.

CORTUSA, BEAR'S-EAR SANCLE; a genus of the monogynia order, belonging to the pentandria class of plants. There are two species, both of them very low, flowery, herbaceous perennials, crowned by umbels of monopetalous, wheel-shaped flowers, of a fine red colour. They are natives of mountainous rocky parts abroad, so must have a dry lean soil; or they may be kept in pots of dry sandy earth placed in the shade, and in summer must be duly watered; and their propagation here is by slipping the roots in October.

CORUNNA, or GROVNE, a port-town of Galicia in Spain, situated on a fine bay of the Atlantic ocean, about 32 miles north of Compostella: W. Long. 9. o. and N. Lat. 43. o.

CORUS, in Jewish antiquity. See HOMER.

CORUS, in our old writers, denotes eight bushels, or a quarter.

CORUS is also a wind, so called by the Jews, rising in the summer in the west; and is that at present called the *north-east wind*.

CORUSATION, a glittering, or gleam of light issuing from any thing. It is chiefly used for a flash of lightning darting from the clouds in time of thunder.

There is a method of producing *artificial coruscations*, or sparkling fiery meteors, which will be visible not only in the dark, but at noon-day, and that from two liquors actually cold. The method is this. Fifteen grains of solid phosphorus are to be melted in about a drachm of water; when this is cold, pour upon it about two ounces of oil of vitriol; let these be shaken together, and they will at first heat, and afterwards they will throw up fiery balls in great number, which will adhere like to many stars to the sides of the glass, and continue burning a considerable time; after this, if a small quantity of oil of turpentine is poured in, without shaking the vial, the mixture will of itself take fire, and burn very furiously. The vessel should be large, and open at the top.

Artificial coruscations may also be produced by means of oil of vitriol and iron, in the following manner. Take a glass body capable of holding three quarts; put into this three ounces of oil of vitriol, and twelve ounces of water; then warming the mixture a little, throw in, at several times, two ounces, or more, of clean iron filings: upon this an ebullition and white vapours will arise: then present a lighted candle to the mouth of the vessel, and the vapour will take fire, and afford a bright fulmination, or flash like lightning. Applying the candle in this manner several times, the effect will always be the same; and sometimes the fire will fill the whole body of the glass, and even circulate to the bottom of the liquor; at others, it will only reach a little way down its neck. The great

Cortex
Coruscation

vorant
rous.

great caution to be used in making this experiment is the making the vapour of a proper heat : for, if too cold, few vapours will arise ; and, if made too hot, they will arise too fast, and will only take fire in the neck of the glass, without any remarkable coruscation.

CORVORANT, formerly written CORMORANT. See PELICANUS.

CORVUS, the RAVEN or CROW kind, in ornithology, a genus of birds of the order of pica; the distinguishing characteristics of which are these : The beak is convex and cultrated : the nostrils are covered with bristly feathers ; the tongue is forked and cartilaginous ; and the feet are of the walking kind. The species are 19. The most remarkable are :

1. The corax, or raven of English authors, weighs three pounds, and is about two feet two inches in length ; the colour is black, finely glossed with a rich blue ; the belly excepted, which is of a dusky colour. They build in trees, and lay five or six eggs of a pale green colour marked with small brownish spots. They are very docile birds, and may be trained up to fowling like hawks ; to fetch and carry like spaniels ; they may be taught to speak like parrots ; and, what is most extraordinary of all, they may be taught to imitate the human voice in singing. They frequent the neighbourhood of great towns, where they are useful in devouring the carcases and filth which would otherwise prove a nuisance. In clear weather they fly in pairs to a great height, making a deep loud noise, different from the common croaking. Their scent is remarkably good ; and they are very long lived. The quills of ravens sell for 12 s. per hundred, being of great use in tuning the lower notes of an harpsichord when the wires are set at a considerable distance from the sticks.

2 The corone, or carrion-crow, in the form of its body agrees with the raven ; also in its food, which is carrion and other filth. It will also eat grain and insects ; and like the raven will pick out the eyes : for which reason it was formerly distinguished from the rook, which feeds entirely on grain and insects, by the name of the *gor*, or *gor-crow*. Virgil says that its croaking foreboded rain :

Tum cornix plena pluvium vocat improba voce.

It was also thought a bird of bad omen, especially if it happened to be seen on the left hand :

Sæpe sinistra cava prædixit ab illic cornix.

England breeds more of this kind of birds than any other country in Europe. In the 24th of Henry VIII. they were grown so numerous, and thought to be so prejudicial to the farmer, that they were considered as an evil worthy of parliamentary redress ; an act was passed for their destruction, in which rooks and choughs were included. Every hamlet was to provide crow-nets for ten years ; and all the inhabitants were obliged at certain times to assemble, during that space to consult of the proper means for extirpating them. But though the crow abounds thus in Britain, it is so rare in Sweden, that Linnaeus speaks of it only as a bird that he once knew killed there. It lays the same number of eggs as the raven, and of the same colour : immediately after deserting their young they go in

pairs. Both these birds are often found white or pied : Corvus. an accident that befalls black birds more frequently than any others. Mr Pennant says, he has observed one entirely of a pale brown colour, not only in its plumage, but even in its bill and feet. The crow weighs about 20 ounces. Its length is 18 inches ; its breadth two feet two inches.

Concerning these birds, we have the following curious anecdote in Mr Edward's natural history *. * Vol. V. Pref. xxv. " The reverend Mr Robinson rector of Ousby in Westmoreland and Cumberland, says, ' that birds are natural planters of all sorts of wood and trees. They disseminate the kernels upon the earth, which like nurseries brings them forth till they grow up to their natural strength and perfection.' He says, ' About 25 years ago, coming from Rosecastle early in the morning, I observed a great number of crows very busily at their work upon a declining ground of a mossy surface : I went out of my way on purpose to view their labour, and I found they were planting a grove of oaks. The manner of their planting was thus : they first made little holes in the earth with their bills, going about and about till the hole was deep enough ; and then they dropped in the acorn, and covered it with earth and moss. The season was at the latter end of autumn when all seeds are full ripe.'

" Mr Robinson seems to think that Providence had given the crows this instinct solely for the propagation of trees ; but I imagine it was given them principally for their own preservation, by hiding provision in time of plenty, in order to supply them in a time of scarcity : for it is observed in tame pies and daws kept about houses, that they will hide their meat when they have plenty of it, and fetch it from their hiding-places when they want it. So that such an instinct in these birds may answer a double purpose ; both their own support in times of need, and the propagation of the trees they plant : for wherever they hide a great number of nuts or grain in the earth, we cannot suppose they find them all again ; but that as many will remain in the plot of ground they make use of, as can well grow by one another."

3. The frugilegus, or rook, is the *corvus* of Virgil ; no other species of this kind being gregarious.

E passu decedens agmine magno

Corporum increpuit densæ exercitus alas.

A very natural description of the evening return of these birds to their nests.

The rook differs not greatly in its form from the carrion crow : the most remarkable difference is in the bill ; the nostrils, chin, and sides of that and the mouth being in old birds quite white and bared of feathers by often thrusting the bill into the ground in search of the erucæ of the dor-beetle †. The rook then, instead of † The *Scorabæus Melanobanus* being proscribed, should be treated as the farmer's friend ; as it clears his ground from caterpillars, which do incredible damage by eating the roots of the corn. Rooks are social birds, living in vast flocks : but crows go only in pairs. They begin to build their nests in March ; one bringing materials, while the other watches the nest, lest it should be plundered by its brethren : they lay the same number of eggs as the crow, and of the same colour, but less. After the breeding season, the rooks forsake their nest-trees, and for

some time go and rook elsewhere, but return to them in August: in October they repair their nests.

4. The cornix, or roylton crow, pretty much resembles the rook, feeding on insects, and flying together in great flocks. In England it is a bird of pasture, visiting that kingdom in the beginning of winter, and leaving it with the woodcocks. In the maritime parts they feed on crabs and shell-fish. They are very common in Scotland: in many parts of the Highlands, and in all the Hebrides, Orkneys, and Shetland, it is the only species of genuine crow; the carrion, and rook, being unknown there. It breeds and continues in those parts the whole year round. In the Highlands, they breed indifferently in all kinds of trees: lay six eggs: have a shriller note than the common crows; are much more mischievous; pick out the eyes of lambs, and even of horses when engaged in bogs. They are, therefore, in many places proscribed, and rewards given for killing them. For want of other food these birds will eat cran-berries, or other mountain berries.

5. The monedula, or jack-daw, weighs nine ounces; the length thirteen inches, the breadth twenty-eight. The head is large in proportion to its body; which, Mr Willughby says, argues him to be ingenious and crafty. The irides are white: the breast and belly are of a dusky hue inclining to ash-colour: the rest of the plumage is black, slightly glossed with blue: the claws very strong and hooked. It is a docile and loquacious bird. Jack-daws breed in steeples, old castles, and in high rocks, laying five or six eggs. Sometimes they have been known to breed in hollow-trees near a rookery, and join those birds in their foraging parties. In some parts of Hampshire, they make their nests in rabbit holes: they also build in the interstices between the upright and transum stones of *Stonhenge*; a proof of the prodigious height of that stupendous antiquity, for their nests are placed beyond the reach of the shepherd boys, who are always idling about this spot. They are gregarious birds; and feed on insects, grain, and feeds.

6. The glandularius, or jay, is one of the most beautiful British birds. The weight is between six and seven ounces: the length 13 inches, the breadth 20½. The forehead is white streaked with black: the head is covered with very long feathers, which it can erect at pleasure into the form of a crest: the whole neck, back, breast, and belly, are of a faint purple dathed with grey: the covert-feathers of the wings are of the same colour. The first quill-feather is black; the exterior webs of the nine next are ash-coloured; the interior webs dusky; the six next are black, but the lower sides of their exterior webs are white tinged with blue; the two next wholly black; the last of a fine bay colour tipped with black. The lesser coverts are of a light bay: the greater covert feathers most beautifully barred with a lively blue, black, and white: the rest are black: the rump is white. The tail consists of twelve black feathers. The feet are of a pale brown; the claws large and hooked. It lays five or six eggs of a dull whitish olive, mottled very obscurely with pale brown. The nest is made entirely of the fine fibres of roots of trees; but has for the foundation a few coarse sticks. It is generally placed on the top

of the underwood, such as hazels, thorns, or low birch. The young follow their parents till the spring: in the summer they are very injurious to gardens, being great devourers of pease and cherries. In the autumn and winter they feed on acorns, from whence the Latin name. Dr Kramer observes, that they will kill small birds. Jays are very docile, and may be taught to imitate the human voice: their native note is very loud and disagreeable. When they are enticing their fledged young to follow them, they emit a noise like the mewling of a cat.

7. The caryocatactes, or nutcracker, is by far the most beautiful of the European birds. It is very common in Germany, Denmark, &c. and feeds on nuts. It is somewhat less than the jack-daw: the bill is strong, straight, and black: the colour of the whole head and neck, breast and body, of a rusty brown: the crown of the head and rump are plain: the other parts marked with triangular white spots: the wings black: the coverts spotted in the same manner as the body: the tail rounded at the end, black tipped with white: the vent-feathers white: the legs dusky.

8. The pica, or magpie, is so well known that it would be superfluous to describe it minutely. It bears a great resemblance to the butcher-bird in its bill, which has a sharp process near the end of the upper mandible. It resembles the same also in the shortness of its wings, and the form of its tail; each feather shortening from the two middlemost. It agrees also in its food, which consists of worms, insects, and small birds. It will destroy young chickens; and is a crafty, restless, and noisy bird. It is easily tamed; and may be taught to imitate the human voice. It builds its nest with great art, covering it entirely with thorns, except one small hole for admittance. It lays six or seven eggs of a pale green colour spotted with green. It weighs near nine ounces: the length is 18 inches; the breadth 24.

9. The graculus, or red-legged crow, is but thinly scattered over the northern world: no mention is made of it by any of the Faunists; nor do we find it in other parts of Europe, except England and the Alps. It is produced in the island of Candia in Asia; and it visits Egypt towards the end of the inundations of the Nile. Except in Egypt, it affects mountainous and rocky places; builds its nest in high cliffs, or ruined towers; and lays four or five eggs, white, spotted with a dirty yellow. It feeds on insects, and also on new-fown corn. They commonly fly high, make a shriller noise than the jack-daw, and may be taught to speak. It is a very tender bird, and unable to bear very severe weather: is of an elegant, slender-make; active, restless and thieving; much taken with glitter, and so meddling as not to be trusted where things of consequence lie. It is very apt to catch up bits of lighted sticks; so that there are instances of houses being set on fire by its means; on which account Camden calls it *incendiaria avis*. It is found in Cornwall, Flintshire, Caernarvonshire and Anglesea, in the rocky cliffs along the shores. It is also found in Scotland as far as Strathnavern; and in some of the Hebrides. Its colour is wholly black, beautifully glossed over with blue, and purple: the legs and bill are of a bright orange colour inclining to red: the tongue is almost as long as the bill, and

Corvus and a little cloven: the claws large, hooked and black.

CORVUS, the *Raven*, in astronomy. See ASTRONOMY, n^o 266.

CORVUS, in Roman antiquity, a military engine, or rather gallery, moveable at pleasure by means of pulleys; chiefly used in boarding the enemy's ships to cover the men. The construction of the corvus was as follows. They erected on the prow of their vessels a round piece of timber of about a foot and an half diameter, and about 12 feet long; on the top of which they had a block or pulley. Round this piece of timber they laid a stage or platform of boards, four feet broad, and about 18 feet long, which was well framed, and fastened with iron. The entrance was long-ways, and it moved about on the above-mentioned upright piece of timber as on a spindle, and could be hoisted up within six feet of the top: about this was a sort of parapet knee-high, which was defended with upright bars of iron sharpened at the end, and towards the top there was a ring, by the help of which and a pulley or tackle, they raised or lowered the engine at pleasure. With this moveable gallery they boarded the enemy's vessels, (when they did not oppose side to side), sometimes on their bow, and sometimes on their stern, as occasion best served. When they had grappled the enemy with these iron spikes, if they happened to swing broadside to broadside, then they entered from all parts; but in case they attacked them on the bow, they entered two and two by the help of this machine, the foremost defending the foreparts, and those that followed the flanks, keeping the bows of their bucklers level with the top of the parapet.

CORYATE (Thomas), a very extraordinary personage, who seems to have made himself famous by his whimsical extravagancies, was the son of a clergyman, and born at Oldcombe in Somersetshire in 1577. He acquired Greek and Latin at Oxford; and coming to London, was received into the household of Henry prince of Wales. If Coryate was not over witty himself, he got acquainted with the wits of that time, and served to exercise their abilities, having more learning than judgment. He was a great peripatetic: for, in 1608, he took a long journey on foot; and after he returned, published his travels under the following strange title, *Crudities hastily gobbled up in five months Travels in France, Savoy, Italy, Rhetia, Helvetia, some parts of High Germany, and the Netherlands*, Lond 1611, 4^{to}. In 1612 he set out again, with a resolution to spend ten years in travelling: he went first to Constantinople; and after travelling over a great part of the East, died of a flux at Surat in the East-Indies. Some of the accounts of his peregrinations are to be found in the accounts of Purchas's Pilgrimages.

CORYBANTES, in antiquity, priests of the goddess Cybele, who, inspired with a sacred fury, danced up and down, tossing their heads, and beating on cymbals or brazen drums. They inhabited mount Ida, in the island of Crete, where they nourished the infant Jupiter, keeping a continual rattling with their cymbals, that his father Saturn, who had resolved to devour all his male offspring, might not hear the child's cries.

CORYBANTICA, in Grecian antiquity, a festival kept in honour of the Corybantes.

VOL. III.

CORYCOMACHIA, among the ancients, was a sort of exercise in which they pushed forwards a ball, suspended from the ceiling, and at its return either caught it with their hands, or suffered it to meet their body. Oribasius informs us it was recommended for extenuating too gross bodies.

CORYDALES, in botany, an order of plants in the *fragmenta methodi naturalis* of Linnæus, containing the following genera, viz. epimedium, hiepecum, leontice, melianthus, pinguicula, and utricularia.

CORYDALIS, in botany. See FUMARIA.

CORYLUS, the HAZLE; a genus of the polyandria order, belonging to the monœcia class of plants. Mr Miller reckons three species, though other botanists make only two. They are all of the large shrub kind, hardy and deciduous; and have several varieties, valuable for their nuts, as also for their variety in large wildernesses and shrubbery works. They will prosper in almost any soil or situation, and turn out to good account when growing in coppices to cut as underwood, and as poles for various uses, as hoops, spars, hurdles, handles to husbandry implements, walking-sticks, fishing-rods, &c. for which purposes they may be cut every 5th, 7th, or 8th year, according to the purposes for which they are designed. The best method of propagating them is by layers, though they may also be raised from the nuts.

CORYMBIFERÆ, in botany, the name of an order or division of the compound flowers adopted by Linnæus after Ray and Vaillant, in the former editions of his *Fragments of a Natural Method*. This title in the latter editions is changed for *Discoideæ*, another name borrowed from Ray's Method, but used in a somewhat different sense.

CORYMBUS, properly signifies a cluster of ivy berries. Among botanists, it is a mode of flowering in which the lesser or partial flower-stalks are produced along the common stalk on both sides; and, though of unequal lengths, rise to the same height, so as to form a flat and even surface at the top. See BOTANY, p. 1294. n^o 32.

CORYPHÆNA, in ichthyology, a genus belonging to the order of thoracici. The head is declined and truncated; the branchiostegæ membrane has six rays; and the back-fin runs the whole length of the back. There are twelve species, most of them natives of foreign seas. The most remarkable are the blue and parrot fishes, described by Mr Catfish. The head of the first is of an odd structure, resembling that of the spermæci whale: the mouth is small, each mandible armed with a single row of even teeth, so closely joined that they seem entire bones; the iris of the eye is red. On the back is a long piliant fin, somewhat indented on the edge; behind the gills are two fins, one under the abdomen, and another behind the anus. The tail is forked; and the whole fish entirely blue. They are taken on the coasts of the Bahama Islands, and in most of the seas between the tropics.

The parrot-fish hath a large mouth, paved as it were with blunt teeth, closely connected, after the manner of the *lupus marinus*. The body is covered with large green scales; the eyes are red and yellow; the upper part of the head brown, the lower part and the

Coryphæus gills blue, bordered with a dusky red : a streak of red extends from the throat behind the gills, at the upper end of which is a bright yellow spot. The fins are five in number, one extending almost the length of the back, of a bay or cinnamon colour ; there are two behind the gills, blended with black, green, and purplish colours, with the upper edge verged with blue : under the abdomen is another red fin verged with blue : under the anus extends another long narrow green fin, with a list of red through the middle of it : at the basis of the tail on each side is a large yellow spot. The tail is large, forked, and green, with a curved red line running through the middle parallel to the curve, and ending in two points. This fish is more esteemed for beauty than the delicacy of its taste. They are taken on the coasts of Hispaniola, Cuba, and the Bahama Islands.

CORYPHÆUS, in the ancient tragedy, was the chief or leader of the company that composed the chorus. See **CHORUS**. The word is formed from the Greek *κορυφή*, "tip of the head." The coryphæus spoke for all the rest, whenever the chorus took part in the action, in quality of a person of the drama, during the course of the acts. Hence coryphæus had passed into a general name for the chief or principal of any company, corporation, sect, opinion, &c. Thus, Eustacius of Antioch is called the *coryphæus* of the council of Nice ; and Cicero calls Zeno the *coryphæus* of the stoics.

CORYZA, in medicine, a catarrh of the nose. See (the *Index* subjoined to) **MEDICINE**.

CORZOLA, or **CURSCOLA**, an island in the gulf of Venice, divided from Ragusa in Dalmatia by a narrow strait. E. Long. 18. o. N. Lat. 42. 35.

COS, the **WHESTONE**, in natural history, a genus of vitrescent stones, consisting of fragments of an indeterminate figure, sub-opaque, and granulated.

Of this genus there are several species, some consisting of rougher, and others of smoother, or even of altogether impalpable particles ; and used not only for whet-stones, but also for mill-stones, and other the like purposes.

CO-SECANT, in geometry, the secant of an arch which is the complement of another to 90°. See **GEOMETRY**.

COSENING. See **COZENING**.

COSENZA, the capital of the Hither Calabria, in the kingdom of Naples. E. Long. 16. 35. N. Lat. 39. 15. It is an archbishop's see.

COSHERING, in the feudal customs, a kind of right of the lords to lie and feast themselves and their followers at their tenants houses. The word *coshering* may perhaps be derived from the old English word *coþbe*, a cot or cottage.

CO-SINE, in trigonometry, the sine of an arch which is the complement of another to 90°. See **GEOMETRY**.

COSMETIC, in physic, any medicine or preparation which renders the skin soft and white, or helps to beautify and improve the complexion ; as lip-salves, cold creams, cerufs, &c.

COSMICAL, a term in astronomy, expressing one of the poetical risings of a star : thus a star is said to rise cosmically when it rises with the sun, or with that

point of the ecliptic in which the sun is at that time : **Cosmic** and the cosmical setting is when a star sets in the west at the same time that the sun rises in the east.

COSMOGONY, or **COSMOLOGY**, a knowledge of the original formation of the different parts of this visible system. See **EARTH**, and **CREATION**.

COSMOGRAPHY, a description of the several parts of the visible world. It is divided into two parts, **ASTRONOMY** and **GEOGRAPHY**. See these two articles.

COSMOPOLITE, or **COSMOPOLITAN**, a term sometimes used to signify a person who has no fixed living or place of abode, or a man who is a stranger nowhere. The word comes from the Greek *κοσμος*, "world," and *πολις*, "city." One of the ancient philosophers being interrogated what countryman he was ? answered, he was a *cosmopolite*, i. e. an inhabitant or citizen of the world.

COSSACKS, a name given to the people inhabiting the banks of the rivers Nieper and Don, near the Black Sea and borders of Turkey. There are several kinds of Cossacks : the most known are those of the Don, the Zaporavian, and the Ukraine Cossacks. They inhabit the Ukraine, which is also called *Mala Russia*, or Little Russia, and is unquestionably one of the finest countries in Europe. They were once a free people, and of the same descent with the Poles. When united, they could bring an army of 150,000 men into the field. They were long under the protection of the republic of Poland, and were of great service in the wars against the Turks. At last, however, the Poles attempted to treat them like slaves ; upon which they revolted, and chose for their leader one *Hettman Chelminski*, who put himself under the protection of the Turks. Some years after the death of Chelminski, his successor Doroschonko submitted himself and his country to the Russians. This brought on a war which terminated in the destruction of the town of Czigrin, at that time the capital of the Ukraine. This happened in 1674. For some years after this they preserved all their privileges, and were governed by a prince of their own choosing. But having taken part with Charles XII. of Sweden against the Russians, they were reduced by Peter the Great, so as to be incapable of ever shaking off the yoke. They were, however, restored to their former state by the empress Elizabeth, in which they still continue.

The customs of this people are singular : no Zaporavian Cossack is allowed to marry within the precincts of their territory. If he is married, his wife must live in some neighbouring country, where he resorts to her from time to time ; and even this intercourse must be without the knowledge of the elders. They do not even suffer women to remain at the house of any stranger that happens to come among them. They are great thieves and robbers ; but, if any one should steal from his neighbour, he is tied to a post in some public place : A bottle of brandy, a loaf of bread, and a number of strong sticks, are set by his side ; when every one that passes has a right to give him as many blows as he pleases ; after which he may refresh the sufferer with a little brandy and a morsel of bread. The criminal remains thus tied for twenty-four hours together, and often five times as long :

long; after which, if he has the good luck to survive the blows, he is again received into the society. The whole republic is made up entirely of thieves and vagabonds, who subsist on nothing but rapine and plunder both in peace and war. The court of Russia cannot hinder their continual excursions; nay, is even obliged to keep measures with them, for fear of their changing sides.

The Don Cossacks were originally Russian peasants, to whom the yoke of their masters having proved intolerable, they by degrees took refuge in this country, where they established themselves into a commonwealth. In process of time they voluntarily put themselves under the protection of the Russian empire, by which they are very mildly treated. They are excellent soldiers, and can bring 15,000 men into the field. Their general, or chief of their republic, is styled *voiskovoy attaman*: he is chosen by themselves from among the principal officers of the nation; but he must be confirmed by the court.

COSSET, among farmers, a colt, calf, or lamb, brought up by hand without the dam.

COSTA (Christopher a), a celebrated botanist of the 16th century, was born in Africa, of a Portuguese father, and went into Asia to perfect himself in the knowledge of simples, where he was taken prisoner, but found means to make his escape, and after several voyages practised physic at Bourges. He wrote, 1. A treatise on Indian drugs and medicines. 2. His voyages to the Indies. 3. A book in praise of women; and other works.

COSTAL, an appellation given by anatomists to several parts belonging to the sides: thus we meet with costal muscles, vertebrae, &c.

COSTANZO (Angelo di), an Italian historian and poet, lord of Catalupo, was born in 1507, of a noble and ancient family of Naples, and died about 1591. He wrote, 1. A history of Naples, from 1250 to 1489, the best edition of which is that of Aquila, in 1582, in folio, very scarce. 2. Italian poems, which are esteemed, and have had several editions.

COSTA-RICCA, a province of North America in New Spain, and in the audience of Guatimala, bounded on the north-east by the northern ocean, on the south-west by the south sea, on the north-west by Nicaragua, and on the south-east by Veragua. The soil is not very fertile, though there is plenty of cattle. Carthage is the capital town.

COSTIVENESS, a preternatural detention of the feces, with an unusual dryness and hardness thereof, and thence a suppression of their evacuation. See (the *Index* subjoined to) MEDICINE.

COSTMARY, the English name of a species of tansy. See TANACETUM.

COSTS, in law, imply the expenses of a suit recovered by the plaintiff, together with damages. Costs were not allowed by the common law, the amercement of the vanquished party being his only punishment; but they are given by statute*. Costs are allowed in chancery for failing to make answer to a bill exhibited; or making an insufficient answer: and if a first answer be certified by a master to be insufficient, the defendant is to pay 40 s.; 3 l. for a second insufficient answer; 4 l. for a third, &c. But if the

answer be reported good, the plaintiff shall pay the defendant 40 s. costs.

COSTUME, a rule or precept in painting, by which the artist is enjoined to make every person and thing sustain its proper character, and not only observe the story, but the circumstances, the scene of action, the country or place, and take care that the habits, arms, manners, proportions, and the like, exactly correspond.

COSTUS, a genus of the monogynia order, belonging to the monandria class of plants. There is but one species, viz. the arabicus, a native of the Indies. The root was formerly in some esteem as an attenuant, and serviceable in venereal complaints; but is now rarely prescribed or met with in the shops.

COTA (Rodriguez), a Spanish poet in the 16th century, was the author of the *Tragi-comedia de Calisto y Melibea*, which has been translated into Latin by Gaspar Barthius, and into French by James de Lavaradin. The Spaniards set a great value on this performance.

CO-TANGENT, the tangent of an arch which is the complement of another to 90°. See GEOMETRY.

COTBUS, a town of Germany in Lower Lusatia: it is a strong important place, and has been subject to the king of Prussia ever since the year 1645. It is seated on the river Spree, 60 miles south by east of Berlin, and 55 south-east of Wirtemberg. Here are a great number of French Protestants, who have introduced manufactures; and this place is noted for excellent beer, pitch, and the cultivation of flax. E. Long. 15. 29. N. Lat. 51. 40.

COTELERIUS (John-Baptist), fellow of the Sorbonne, and king's Greek professor, was born at Nismes in Languedoc in 1627. He made a collection of the fathers who lived in the apostolic age, which he published at Paris in two volumes folio in 1672; all reviewed and corrected from several MSS. with a Latin translation and notes. He also published *Monumenta Ecclesie Græcæ*, in 3 vols. being a collection of Greek tracts out of the king's and M. Colbert's libraries, and which had never been published before: to these he added a Latin translation and notes. He intended a farther prosecution of this work; but his intense studies broke his constitution, and deprived him of life in 1686. Besides his great skill in languages and ecclesiastical antiquities, Cotelierus was remarkable for his probity and candour.

COTES (Roger), an excellent mathematician of the 18th century. He early discovered an inclination to the mathematics; and, at 17 years of age, was admitted a pensioner of Trinity College, Cambridge. In 1706 he was appointed professor of astronomy in the professorship founded by Dr Plume archdeacon of Rochester, being chosen the first in that chair for his great merit and learning. In the year 1713, at the request of Dr Richard Bentley, he published at Cambridge, in quarto, a second edition of Sir Isaac Newton's "Principia," with all the improvements which the author had annexed thereto; to which he prefixed an excellent *Preface*. He prepared several useful books for the public; and wrote *A Description of the great Meteor* which appeared on the 6th of March 1716, published in the Philosophical Transactions. He

Cote-fowl lived but a little while to carry on the discourses for which he was eminently qualified; dying in the prime of his age in 1716, to the great regret of all the lovers of the sciences.

Cotton.

COTESWOLD, several sheep-cotes, and sheep feeding on hills. It comes from the Saxon *cote*, i. e. *cass*, "a cottage," and *wold*, "a place where there is no wood."

COTHURNIX, in ornithology, a species of *TERTRAO*.

COTHURNUS, **BUSKIN**, a very high shoe, or patten raised on soles of cork, wore by the ancient actors in tragedy to make them appear taller and more like the heroes they represented; most of whom were supposed to be giants. It covered the greatest part of the leg, and was tied beneath the knee. *Aeschylus* is said to have invented the cothurnus. See **BUSKIN**.

COTT, a particular sort of bed-frame, suspended from the beams of a ship, for the officers to sleep in between the decks. This contrivance is much more convenient at sea than either the hammocks or fixed cabins; being a large piece of canvas sewed into the form of a chest, about six feet long, one foot deep, and from two to three feet wide: it is extended by a square wooden frame with a canvas bottom, equal to its length and breadth, to retain it in an horizontal position.

COTTON, in commerce, a soft downy substance found on the gossypium, or cotton-tree. See **GOSSEPIUM**.

Cotton is separated from the seeds of the plant by a mill, and then spun and prepared for all sorts of fine works, as stockings, waistcoats, quilts, tapestry, curtains, &c. With it they likewise make muslin; and sometimes it is mixed with wool, sometimes with silk, and even with gold itself.

The finest sort comes from Bengal and the coast of Coromandel.

Cotton makes a very considerable article in commerce, and is distinguished into cotton-wool and cotton-thread. The first is brought mostly from Cyprus, St John d'Acre, and Smyrna: the most esteemed is white, long, and soft. Those who buy it in bales should see that it has not been wet, moisture being very prejudicial to it. The price of the finest is usually from six to seven pence the quintal of 44 coss.

Of cotton-thread, that of Damas, called *cotton d'ounce*, and that of Jerusalem, called *bazar*, are the most esteemed; as also that of the Antilles islands: It is to be chosen white, fine, very dry, and evenly spun. The other cotton-threads are the half bazas; the rames, the beledin, and gondezel; the payas and montafiri, the genequins, the baquins, the jossellafars, of which there are two sorts. Those of India, known by the name of Tutucorin, Java, Bengal, and Surat, are of four or five sorts, distinguished by the letters A, B, C, &c. They are sold in bags, with a deduction of one pound and a half on each of those of Tutucorin, which are the dearest, and two pounds on each bag of the other sorts. For those of Fielesbas, Smyrna, Aleppo, and Jerusalem, the deduction at Amsterdam is eight in the hundred for the tare, and two

in the hundred for weight, and on the value one per cent. for prompt payment.

Cotton of Siam, is a kind of silky cotton in the Antilles, so called because the grain was brought from Siam. It is of an extraordinary fineness, even surpassing silk in softness. They make hosiery of it there preferable to silk ones, for their lustre and beauty. They sell from 10 to 12 and 15 crowns a pair, but there are very few made unless for curiosity.

The manner of Packing COTTON as practised in the Antilles. The bags are made of coarse cloth, of which they take three ells and a half each; the breadth is one ell three inches. When the bag has been well soaked in water, they hang it up, extending the mouth of it to cross pieces of timber nailed to posts fixed in the ground seven or eight feet high. He who packs it goes into the bag, which is six feet nine inches deep, or thereabouts, and presses down the cotton, which another hands him, with hands and feet; observing to tread it equally every where, and putting in but little at a time. The best time of packing is in rainy moist weather, provided the cotton be under cover. The bag should contain from 300 to 320 pounds. The tare abated in the Antilles is three in the hundred. Cotton being a production applicable to a great variety of manufactures, it cannot be too much cultivated in our own plantations that will admit of it.

Cotton-wool, not of the British plantations, pays, on importation, $7\frac{1}{2}$ d. the pound, and draws back on exportation $57\frac{1}{2}$ d. Cotton-yarn the pound, not of the

East Indies, pays $2\frac{87}{100}$ d. and draws back $2\frac{58}{100}$ d.

Cotton-yarn the pound of the East Indies pays $4\frac{7}{100}$ d. and draws back $4\frac{3}{100}$ d.

Lowender COTTON. See **SANTOLINA**.

Philosophic COTTON, a name given to the flowers of zinc, on account of their white colour, and resemblance to cotton.

Flax made to resemble COTTON. See **FLAX**.

Silk COTTON. See **BOMBAX**.

COTTON-Wood. See **GNAPHALUM**.

COTTON (Sir Robert), a most eminent English antiquarian, descended from an ancient family, was born in 1570. In his 18th year he began to collect ancient records, charters, and other MSS. Camden, Selden, and Speed, acknowledged their obligations to him in their respective works. He was highly distinguished by queen Elizabeth, and by James I. who created him a baronet. He wrote many things himself; but our principal obligations to him are for his valuable library of MSS. which was secured to the public by two acts of parliament, and now makes part of the British museum.

COTTON (Charles), a burlesque poet, was descended of a good family, and lived in the reigns of Charles II. and James II. His most celebrated piece is *Scarronides*, or *Travels* of the first and fourth books of the *Æneid*. But though, from the title, one would be apt to imagine it an imitation of Scarron's famous *Travels* of the same author, yet, upon examination, it would be found greatly to excel not only that, but every other attempt of the same kind that hath been

hitherto

hitherto made in any language. He has also translated several of Lucian's dialogues, in the same manner, under the title of the *Scoffler Scoff'd*;—and written another poem of a more serious kind, entitled the *Wonders of the Peak*. The exact period of either Mr Cotton's birth or his death, is no-where recorded; but it is probable the latter happened about the time of the revolution. Neither is it better known what his circumstances were with respect to fortune; they appear, however, to have been easy, if one may judge from the turn of his writings, which is such as seems scarcely possible for any one to indulge whose mind was not perfectly at ease. Yet there is one anecdote told of him, which seems to shew that his vein of humour could not restrain itself on any consideration, viz. that in consequence of a single couplet in his *Virgil Travels*, wherein he has made mention of a peculiar kind of ruff worn by a grandmother of his who lived in the Peak, he lost an estate of L. 400 *per annum*; the old lady, whose humour and petty disposition he could by no means have been a stranger to, being never able to forgive the liberty he had taken with her; and having her fortune wholly at her disposal, although she had before made him her sole heir, altered her will, and gave it away to an absolute stranger.

COTTUS, or BULL-HEAD, in ichthyology, a genus belonging to the order of thoracici. The head is broader than the body, and the gill-membrane has six rays. There are six species; the most remarkable are,

1. The gobio, or river bull-head, is very common in all our clear brooks; it lies almost always at the bottom, either on the gravel, or under a stone: it deposits its spawn in a hole, which it forms among the gravel, and quits it with great reluctance. It feeds on water insects. This fish seldom exceeds the length of three inches and an half: the head is large, broad, flat, and thin at its circumference, being well adapted for insinuating itself under stones: on the middle part of the covers of the gills is a small crooked spine turning inwards. The eyes are very small: the irides yellow: the body grows slender towards the tail, and is very smooth. The colour of this fish is as disagreeable as its form, being dusky, mixed with a dirty yellow; the belly is whitish. The taste, however, is excellent.

2. The cataphractus, armed bull-head, or *pogge*, is very common on most of the British coasts. It seldom exceeds five inches and an half in length; and even seldom arrives at that size. The head is large, bony, and very rugged: the end of the nose is armed with four short upright spines: on the throat are a number of short white beards: the body is octagonal, and covered with a number of strong bony crusts, divided into several compartments, the ends of which project into a sharp point, and form several echinated lines along the back and sides from the head to the tail.

3. The scorpius, or father-lather, is not uncommon on the rocky coasts of this island; it lurks under stones, and will take a bait. It seldom exceeds 8 or 9 inches in length. The head is large, and has a most formidable appearance, being armed with vast spines, which it can oppose to any enemy that attacks it, by swelling

out its cheeks and gill-covers to a large size. The nose and space contiguous to the eyes are furnished with short sharp spines: the covers of the gills are terminated by exceeding long ones, which are both strong and very sharp pointed. The mouth is large; the jaws covered with very small teeth: the roof of the mouth is furnished with a triangular spot of very minute teeth. The back is more elevated than that of the others of this genus: the belly is prominent: the side line rough, the rest of the body very smooth, and grows slender towards the tail. The colour of the body is brown, or dusky and white marbled, and sometimes is found also stained with red: the fins and tail are transparent, sometimes clouded, but the rays barred regularly with brown: the belly is of a silvery white. This species is very frequent in the Newfoundland seas, where it is called *scoping*: it is also as common on the coast of Greenland, in deep water near the shore. It is a principal food of the natives, and the soup made of it is said to be agreeable as well as wholesome.

COTULA, MAY-WEED; a genus of the polygamia superflua order, belonging to the syngenesia class of plants. There are six species, all of them herbaceous annuals, rising 6 or 8 inches high, and adorned with yellow flowers. There are none of them natives of this country, and most of them require artificial heat.

COTULA, or *Cotyla*, in antiquity, a liquid measure among the Greeks, equal to the hemina of the Romans, containing half a sextary, or four acetabula: hence it appears that it contained 10 ounces of wine, and 9 of oil.

COTURNIX, in ornithology. See TETRAO.

COTYLEDON, NAVEL-WORT; a genus of the pentagynia order, belonging to the decandria class of plants. There are eight species, most of them hardy succulent perennials; though some require to be kept in a stove, as being natives of warm climates. They rise from half a foot to a yard and an half high, and are adorned with yellow flowers growing in umbels. They are easily propagated either by seed or cuttings of their branches.

COTYLEDONES, in anatomy, are certain glandular bodies, adhering to the chorion of some animals. *Milne's Bot. Diff.*

COTYLEDONES, in botany, the perishable, porous side-lobes of the seed, which involve, and for some time furnish nourishment to, the embryo plant. The lobes in question, which are generally two in number, are very conspicuous in the bean and most of the leguminous tribe, on stripping off the hulk or outer cover of the seed; particularly if they have previously been laid in earth or water. Their substance is mealy, mucilaginous, and easily ferments. They result from the expansion of an infinite number of branching vessels. The lobes are externally convex, internally flat, unless where they are united and infold the principle of life, *corculum*, which communicates with them by means of two large trunks of vessels that supply it with nourishment, and correspond to the navel-string in animals; as the lobes themselves seem to answer the purpose of the placenta in women, and cotyledons in brutes, &c.

We said, in the definition, that the lobes are the perishable parts of the seed. To explain this we must previously

Cotyledones.
|
Couch.

previously observe the changes which are effected on the embryo plant in the first stages of vegetation. After lying some time in water or earth, the lobes of the seed, penetrated by the watery particles, which are charged with nutritive juices, put in motion by the heat, swell and thicken; the air, contained within their substance, dilating, bursts open the outer cover or husk which unites them, and discovers the radicle and embryo-plant. In this first stage the seed is said properly to sprout or germinate. Soon after, the lobes expanding, rise out of the earth in the form of leaves; very different, however, from those which the plant is afterwards to produce. In this stage the seed is properly said to rise. These leaves, called for distinction's sake *feminal* or *seed leaves*, (that is, the first leaves produced by the seeds), are commonly two in number: some seeds, however, have only one feminal leaf; in which case the plants, by botanists, are called *monocotyledonous*, a term of the same import; as those which rise with two feminal leaves are styled *dicotyledonous*. Cæsalpinus and Jungius termed both these kinds of seeds *uniovular* and *biovular*; that is, having one or two seed-covers. The former was the first who discovered the number of lobes in the embryo of seeds.—To proceed with our infant plant. Under this new form of leaves, the lobes elaborate and rectify the sap, which is destined to nourish the tender vegetable. The young root too, which naturally tends downwards, has by this time made some efforts to penetrate into the bosom of the earth, where meeting with strong exhilarating juices, it transmits them to the lobes, through which they pass, highly refined, to the future plant. The stem begins to appear; but, though enlarged in volume, its parts are not developed or unfolded, but continue as they were in the seed. The lobes still united to the plant by the two trunks of the vessels, accompany it for some time after its eruption from the earth, till, having acquired sufficient strength and growth, the feminal leaves become useless, wrinkle, wither, and die away. See GERMINATION.

Of plants which have only one feminal leaf, we must carefully distinguish those in which the lobe forms a sort of sheath surrounding the whole body of the plant, as in the palms, grasses, and liliaceous vegetables; from those in which the lobe is only extended in length, as in dodder. Pine, and fir-trees, says Linnæus, have ten; cypress, five; flax, four lobes: in fact, however, these plants have only two lobes, each of which is differently divided, almost to the base; the lobes only being perfectly distinct. The lobes being in the vegetable economy what the placenta is in the animal, their disposition at the time when the seed begins to grow, is termed very properly, by Linnæus, PLACENTATION.

In the mushrooms, ferns, and other imperfect plants, the feminal leaves are not sufficiently ascertained. The seeds of the mosses want only the proper coverings and lobes.

COTYTTIA, or COTYTTIS, in antiquity, a nocturnal festival in honour of *Cotys*, or *Cutyttia*, the goddess of wantonness.

COUCH, in painting, a term used for each lay or impression of colour, either in oil or water, wherewith

the painter covers his canvas, wall, waincot, or other matter to be painted.

Couch-Grass, in botany. See TRITICUM.

COUCHANT, in heraldry, is underfoot of a lion, or other beast, when lying down, but with his head raised; which distinguishes the posture of couchant from dormant, wherein he is supposed quite stretched out and asleep.

COUCHE, in heraldry, denotes any thing lying along: thus, chevron-couché, is a chevron lying sideways, with the two ends on each side of the shield, which should properly rest on the base.

COUCHING of a CATARACT, in surgery. See SURGERY.

COVENANT, in law, is the consent and agreement of two or more persons to do, or not to do, some act, or thing, contracted between them. Also it is the declaration the parties make, that they will stand to such agreement, relating to lands or other things; and is created by deed in writing, sealed and executed by the parties, or otherwise it may be implied in the contract as incident thereto. And if the persons do not perform their covenants, a writ or action of covenant is the remedy to recover damages for the breach of them.

COVENTRY, a town of Warwickshire in England, situated in W. Long. 1. 26. N. Lat. 52. 25. It is an ancient place, and is supposed to derive its name from a convent formerly situated here. Hither Robert de Limsey, bishop of Litchfield and Chester, removed his see, tempted, as it is said, by the wealth of the convent: however, the see returned in a short time to Litchfield again; but with this condition, that the bishop should be styled of Litchfield and Coventry. Leofric, earl of Mercia, who rebuilt the religious house after it had been destroyed by the Danes, and was lord of the place about the year 1040, is said, upon some provocation, to have loaded them with heavy taxes. Being importuned by his lady, Godiva, to remit them, he consented, upon condition that she should ride naked through the town, which he little imagined she would ever comply with. But he found himself mistaken: for she accepted the offer, and rode through the town with her long hair scattered all over her body; having first enjoined the citizens not to venture, on pain of death, to look out as she passed. It is said, however, that a certain taylor could not help peeping; and to this day there is an effigy of him at the window whence he looked. To commemorate this extraordinary transaction, and out of respect to the memory of their patroness, the citizens make a procession every year, with the figure of a naked woman on horseback. After Leofric's death, the earls of Chester became lords of the city, and granted it many privileges. At length it was annexed to the earldom of Cornwall; and growing considerable, had divers immunities and privileges conferred upon it by several kings, particularly that of a mayor and two bailiffs by Edward III.; and Henry VI. made it, in conjunction with some other towns and villages, a distinct county, independent of the county of Warwick. But afterwards Edward IV. for their disloyalty, deprived them of their liberties, which were not restored, till they had paid a fine of 500 merks. By a charter from
James

Couch
|
Coventry.

James I. an alderman is allotted to each ward, with the powers of the justices of the peace within the city and its liberties. The walls were ordered to be demolished at the reformation; and now nothing remains of them but the gates, which are very lofty. Coventry is noted for the two parliaments which were held in it; the one called the parliament of *Dunces*, and the other of *Devils*. The former was so called on account of the exclusion of the lawyers; and the attainders of the duke of York, the earls of Salisbury, Warwick, and March, procured the other the epithet of *Devils*. The town-house of Coventry is much admired for its painted windows representing several kings and others that have been benefactors to the city. The chief manufactures carried on here are tennies and ribbands.

CO-VERSED SINE, in geometry, the remaining part of the diameter of a circle, after the versed sine is taken from it. See GEOMETRY.

COVERT-WAY, or CORRIDOR, in fortification, a space of ground, level with the field on the edge of the ditch, three or four fathoms broad, ranging quite round the half moons and other works toward the country. It has a parapet raised on a level, together with its banquetts and glacis. See FORTIFICATION.

COVERTURE, in law, is applied to the state and condition of a married woman, who is under the power of her husband, and therefore called *femme covert*.

COUGH, in medicine. See (Index subjoined to) MEDICINE.

COUGH, in farriery. See FARRIERY, § vi.

COVIN, a deceitful compact or agreement between two or more to deceive or prejudice a third person: As, if a tenant for life conspire with another, that this other shall recover the land which the tenant holds, in prejudice of him in reversion. Dr Skinner takes the word to be a corruption of the Latin *conventum*, and therefore writes it *coven*. See CONSPIRACY.

COVING, in building, is when houses are built, projecting over the ground-plot, and the turned pro-jecture arched with timber, lathed and plastered.

COULTER, in husbandry, an iron-instrument, fixed in the beam of a plough, and serving to cut the edge of each furrow. See AGRICULTURE, p. 143. col. 1.

COUNCIL, or COUNSEL, in a general sense, an assembly of divers considerable persons to concert measures relating to the state.

In Britain, the law, in order to assist the king in the discharge of his duties, the maintenance of his dignity, and the exertion of his prerogative, hath assigned him a diversity of councils to advise with.

1. The first of these is the high court of parliament. See PARLIAMENT.

2. The peers of the realm are by their birth hereditary counsellors of the crown; and may be called together by the king, to impart their advice in all matters of importance to the realm, either in time of parliament, or, which hath been their principal use, when there is no parliament in being. Accordingly, Bracton, speaking of the nobility of his time, says, they might properly be called, "consules a consulendo; reges enim tales sibi associant ad consulendum." And in the law-books it is laid down, that the peers are crea-

ted for two reasons: 1. *Ad consulendum*, 2. *Ad defendendum, regem*: for which reasons the law gives them certain great and high privileges; such as freedom from arrests, &c. even when no parliament is sitting; because the law intends, that they are always assisting the king with their counsel for the common-wealth, or keeping the realm in safety by their prowess and valour.

Instances of conventions of the peers, to advise the king, have been in former times very frequent; though now fallen into disuse, by reason of the more regular meetings of parliament. Sir Edward Coke gives us an extract of a record, 5 Henry IV. concerning an exchange of lands between the king and the earl of Northumberland, wherein the value of each was agreed to be settled by advice of parliament, (if any should be called before the feast of St Lucia), or otherwise by advice of the grand council of peers, which the king promises to assemble before the said feast, in case no parliament shall be called. Many other instances of this kind of meeting are to be found under our ancient kings: though the formal method of convoking them had been so long left off, that when king Charles I. in 1640, issued out writs under the great seal, to call a council of all the peers of England, to meet and attend his majesty at York, previous to the meeting of the long parliament, the earl of Clarendon mentions it as a new invention, not before heard of; that is, as he explains himself, so old, that it had not been practised in some hundreds of years. But though there had not for long before been an instance, nor has there been any since, of assembling them in so solemn a manner, yet, in cases of emergency, our princes have at several times thought proper to call for, and consult as many of the nobility as could easily be brought together: as was particularly the case with king James II. after the landing of the prince of Orange; and with the prince of Orange himself, before he called the convention parliament which afterwards called him to the throne.

Besides this general meeting, it is usually looked upon to be the right of each particular peer of the realm, to demand an audience of the king, and to lay before him with decency and respect such matters as he shall judge of importance to the public weal. And therefore, in the reign of Edward II. it was made an article of impeachment in parliament against the two Hugh Spencers, father and son, for which they were banished the kingdom, "that they by their evil covin would not suffer the great men of the realm, the king's good counsellors, to speak with the king, or to come near him; but only in presence and hearing of said Hugh the father, and Hugh the son, or one of them, and at their will, and according to such things as pleased them."

3. A third council belonging to the king, are, according to Sir Edward Coke, his judges of the courts of law, for law-matters. And this appears frequently in the English statutes, particularly 14 Edward III. c. 5. and in other books of law. So that when the king's council is mentioned generally, it must be defined, particularized, and understood, *secundum subjectam materiam*; "according to the subject matter:" and if the subject be of a legal nature, then by the king's

Black-
Com-
ment.

Council. king's council is undertook his council for matters of law; namely, his judges. Therefore, when by statute 16 Richard II. c. 5. it was made a high offence to import into England any papal bulls, or other processes from Rome; and it was enacted, that the offenders should be attached by their bodies, and brought before the king and his council to answer for such offence; here, by the expression of king's council, were understood the king's judges of his courts of justice, the subject-matter being legal: this being the general way of interpreting the word council.

4. But the principal council belonging to the king is his *privy council*, which is generally, by way of eminence, called the council. And this, according to Sir Edward Coke's description of it, is a noble, honourable, and reverend assembly, of the king, and such as he wills to be of his privy council, in the king's court or palace. The king's will is the sole constituent of a privy councillor; and this also regulates their number, which was anciently twelve, or thereabouts. Afterwards it increased to so large a number, that it was found inconvenient for secrecy and dispatch; and therefore, king Charles II. in 1679, limited it to 30: whereof 15 were to be the principal officers of state, and those to be counsellors *virtute officii*; and the other 15 were composed of ten lords and five commoners of the king's choosing. But since that time the number has been much augmented, and now continues indefinite. At the same time also, the ancient office of lord president of the council was revived in the person of Anthony earl of Shaftesbury; an officer that by the statute of 31 Henry VIII. c. 10. has precedence next after the chancellor and lord treasurer.

Privy counsellors are made by the king's nomination, without either patent or grant; and, on taking the necessary oaths they become immediately privy counsellors during the life of the king that chooses them, but subject to removal at his discretion.

As to the qualifications of members to sit at this board; any natural subject of England is capable of being a member of the privy council; taking the proper oaths for the security of government, and the test for security of the church. But, in order to prevent any persons under foreign attachments from insinuating themselves into this important trust, as happened in the reign of king William in many instances, it is enacted, by the act of settlement, that no person born out of the dominions of the crown of England unless born of English parents, even tho' naturalized by parliament, shall be capable of being of the privy council.

The duty of a privy councillor appears from the oath of office, which consists of seven articles: 1. To advise the king according to the best of his cunning and discretion. 2. To advise for the king's honour, and good of the public, without partiality through affection, love, meed, doubt, or dread. 3. To keep the king's counsel secret. 4. To avoid corruption. 5. To help and strengthen the execution of what shall be there resolved. 6. To withstand all persons who would attempt the contrary. And lastly, in general, to observe, keep, and do all that a good and true counsellor ought to do to his sovereign lord.

The power of the privy council is to inquire into all offences against the government, and to commit

the offenders to safe custody, in order to take their trial in some of the courts of law. But their jurisdiction herein is only to inquire, and not to punish: and the persons committed by them are intitled to their *habeas corpus* by statute 16 Car. I. c. 10. as much as if committed by an ordinary justice of the peace. And, by the same statute, the court of star-chamber, and the court of requests, both of which consisted of privy-counsellors, were dissolved; and it was declared illegal for them to take cognizance of any matter of property belonging to the subjects of this kingdom. But, in plantation or admiralty causes, which arise out of the jurisdiction of this kingdom; and in matters of lunacy and idiocy, being a special flower of the prerogative; with regard to these, although they may eventually involve questions of extensive property, the privy council continues to have cognizance, being the court of appeal in such cases; or rather, the appeal lies to the king's majesty himself in council. Whenever also a question arises between two provinces in America or elsewhere, as concerning the extent of their charters and the like, the king in his council exercises original jurisdiction therein, upon the principles of feudal sovereignty. And so likewise when any person claims an island or a province, in the nature of a feudal principality, by a grant from the king or his ancestors, the determination of that right belongs to his majesty in council: as was the case of the earl of Derby with regard to the isle of Man in the reign of queen Elizabeth; and of the earl of Cardigan and others, as representatives of the duke of Montague, with relation to the island of St Vincent in 1764. But from all the dominions of the crown, excepting Great Britain and Ireland, an *appellate* jurisdiction (in the last resort) is vested in the same tribunal; which usually exercises its judicial authority in a committee of the whole privy council, who hear the allegations and proofs, and make their report to his majesty in council, by whom the judgment is finally given.

The privileges of privy counsellors as such, consist principally in the security which the law has given them against attempts and conspiracies to take away their lives. For, by statute 3 Hen. VII. c. 14. if any of the king's servants of his household conspire to take away the life of a privy counsellor, it is felony, though nothing be done upon it. And the reason of making this statute, Sir Edward Coke tells us, was, because such servants have greater and readier means, either by night or by day, to destroy such as be of great authority and near about the king; and such a conspiracy was, just before this parliament, made by some of king Henry the seventh's household servants, and great mischief was like to have ensued thereupon. This extends only to the king's menial servants. But the statute 9 Anne, c. 16. goes farther, and enacts, that any person that shall unlawfully attempt to kill, or shall unlawfully assault and strike, or wound, any privy counsellor in the execution of his office, shall be a felon without benefit of clergy. This statute was made upon the daring attempt of the Sieur Guiscard, who stabbed Mr Harley, afterwards earl of Oxford, with a penknife, when under examination for high crimes in a committee of the privy council.

The dissolution of the privy council depends upon the

the king's pleasure; and he may, whenever he thinks proper, discharge any particular member, or the whole of it, and appoint another. By the common law also it was dissolved *ipso facto*, by the king's demise; as deriving all its authority from him. But now, to prevent the inconveniences of having no council in being on the accession of a new prince, it is enacted by statute 6 Anne, c. 7. that the privy council shall continue for six months after the demise of the crown, unless sooner determined by the successor.

Aulic COUNCIL. See *AULIC*.

Cabinet COUNCIL, the same with *Privy COUNCIL*.

Common COUNCIL, in the city of London, is a court wherein are made all bye-laws which bind the citizens. It consists, like the parliament, of two houses; an upper, composed of the lord mayor and aldermen; and a lower, of a number of common-council men, chosen by the several wards, as representatives of the body of the citizens.

Privy COUNCIL, the *primum mobile* of the civil government of Great Britain, bearing part of that great weight in the government which otherwise would be too heavy upon the king. See *COUNCIL*, *supra*, n^o 4.

COUNCIL of War, an assembly of the principal officers of an army or fleet, occasionally called by the general or admiral to concert measures for their conduct with regard to sieges, retreats, engagements, &c.

COUNCIL, in church-history, an assembly of prelates and doctors, met for the regulating matters relating to the doctrine or discipline of the church.

National COUNCIL, is an assembly of prelates of a nation under their primate or patriarch.

Oecumenical or General COUNCIL, is an assembly which represents the whole body of the universal church. The Romanists reckon eighteen of them; Bullinger, in his treatise de Conciliis, six; Dr Prideaux, seven; and bishop Beveridge has increased the number to eight, which, he says, are all the general councils which have ever been held since the time of the first Christian emperor. They are as follows: 1. The council of Nice, held in the reign of Constantine the Great, on account of the heresy of Arius. 2. The council of Constantinople, called under the reign and by the command of Theodosius the Great, for much the same end that the former council was summoned. 3. The council of Ephesus, convened by Theodosius the younger, at the suit of Nestorius. 4. The council of Calcedon, held in the reign of Marcian, which approved of the Eutychian heresy. 5. The second council of Constantinople, assembled by the emperor Justinian, condemned the three chapters taken out of the book of Theodorus of Mopsuestia, having first decided that it was lawful to anathematize the dead. Some authors tell us, that they likewise condemned the several errors of Origen about the Trinity, the plurality of worlds, and pre-existence of souls. 6. The third council of Constantinople, held by the command of Constantine Pogonatus the emperor, in which they received the definitions of the five first general councils, and particularly that against Origen and Theodorus of Mopsuestia. 7. The second Nicene council. 8. The fourth council of Constantinople, assembled when Lewis II. was emperor of the West. The regulations which they made are contained in twenty-seven canons, the

VOL. III.

heads of which are set down by M. du Pin, to whom the reader is referred.

COUNSEL, in a general sense, signifies advice or instruction how to behave in any difficult matter.

COUNSEL, or *Advocates*, in English courts of law, are of two species or degrees; *BARRISTERS* and *SERJEANTS*. See these articles.

From both these degrees some are usually selected to be his majesty's counsel, learned in the law; the two principal of whom are called his *attorney-general*, and *solicitor-general*. The first king's counsel, under the degree of serjeant, was Sir Francis Bacon, who was made so, *honoris causa*, without either patent or fee: so that the first of the modern order (who are now the sworn servants of the crown, with a standing salary) seems to have been Sir Francis North, afterwards lord keeper of the Great Seal to king Charles II. These king's counsel answer, in some degree, to the advocates of the revenue, *advocati fisci*, among the Romans. For they must not be employed in any cause against the crown without special licence; in which restriction they agree with the advocates of the fisc: but, in the imperial law, the prohibition was carried still farther, and perhaps was more for the dignity of the sovereign; for, excepting some peculiar causes, the fiscal advocates were not permitted to be at all concerned in private suits between subject and subject. A custom has of late years prevailed of granting letters-patent of precedence to such barristers as the crown thinks proper to honour with that mark of distinction: whereby they are entitled to such rank and precedence as are assigned in their respective patents; sometimes next after the king's attorney-general, but usually next after his majesty's counsel next being. These, as well as the queen's attorney and solicitor-general, rank promiscuously with the king's counsel; and, together with them, sit within the bar of their respective courts: but receive no salaries, and are not sworn; and therefore are at liberty to be retained in causes against the crown.

And all other serjeants and barristers indiscriminately, (except in the court of common-pleas, where only serjeants are admitted), may take upon them the protection and defence of any suitors, whether plaintiff or defendant; who are therefore called their *clients*; like the dependents on the ancient Roman orators. These indeed practised *gratis*, for honour merely, or at most for the sake of gaining influence: and so likewise it is established with us, that a counsel can maintain no action for his fees; which are given, not as *locatio vel conductio*, but as *quiddam honorarium*; not as a salary or hire, but as a mere gratuity, which a counsellor cannot demand without doing wrong to his reputation; as is also laid down with regard to advocates in the civil law, whose *honorarium* was directed, by a decree of the senate, not to exceed in any case 10,000 sesterces, or about 80l. of English money. And in order to encourage due freedom of speech in the lawful defence of their clients; and at the same time to check the unseemly licentiousness of prostitute and illiberal men (a few of whom may sometimes insinuate themselves even into the most honourable professions), it hath been holden that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in the client's instructions; altho'

it should reflect upon the reputation of another, and even prove absolutely groundless; but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured. And counsel guilty of deceit and collusion are punishable by the statute Westm. 1. 3 Edw. 1. c. 28. with imprisonment for a year and a day, and perpetual silence in the courts: a punishment still sometimes inflicted for gross misdemeanours in practice.

COUNSELLOR, in general, a person who advises another: thus we say, a counsellor at law, a privy counsellor, &c.

COUNSELLOR at Law, a person retained by a client to plead his cause in a public court of judicature.

COUNT, a title of foreign nobility, which answers to that of earl among us. Counts *palatine* were formerly such as had an office in the king's palace, as appears by their titles; but counts palatine in England were such as had regal power within their own jurisdiction. Counts were originally lords of the court, or of the emperor's retinue; and had their name *comites*, a *comitendo*.

In the courts of the Roman emperors, from Augustus downwards, there were certain counsellors who attended the emperor both at home and abroad, to assist him with their advice upon all occasions. These counsellors were styled *comites augustales*, or *comites augusti*, "companions of the emperor," from their constant attendance on his person. They were divided into three orders or degrees, and those of each order had certain privileges and appointments while they attended the imperial court. As these *comites* or companions had frequent access to the emperors, they often stood high in their favour; and obtained from them the government of provinces, towns, forts, and castles, and other offices of profit and honour. When they left the Imperial court, in order to take upon them their respective governments, they then changed their general title of *comites augustales*, for one taken from the particular government to which they were appointed. Such were the counts of Britain, and of the Saxon shire in Britain.

COUNT-Wheel, in the striking part of a clock, a wheel which moves round once in 12 or 24 hours. It is sometimes called the *locking-wheel*.

COUNTER, a term which enters into the composition of diverse words of our language, and generally implies opposition; but when applied to deeds, means an exact copy kept of the contrary party, and sometimes signed by both parties.

COUNTER-Changed, in heraldry, the intermixture, or opposition of any metal with a colour. See *HERALDRY*, n° 30. Examp. 17, 18, &c.

COUNTER-Flory, in heraldry, is said of a tressure whose flower-de-luce are opposite to others. *Ibid.* n° 40. Examp. 7.

COUNTER-Drawing, in painting, is the copying a design, or painting; by means of a fine linen-cloth, an oiled paper, or other transparent matter, where the strokes appearing through are followed with a pencil, with or without colour. Sometimes it is done on glass, and with frames or nets divided into squares with silk or with thread, and also by means of instru-

ments invented for the purpose, as the parallelogram.

COUNTER-Ermine, in heraldry, is the contrary of ermine, being a black field with white spots.

COUNTERFEITS, in law, are persons that obtain any money or goods by counterfeit letters or false tokens, who being convicted before justices of assize or of the peace, &c. are to suffer such punishment as shall be thought fit to be inflicted under death, as imprisonments, pillory, &c.

COUNTER-FOIL, or **COUNTER-STOCK**, in the exchequer, that part of tally which is kept by an officer of the court.

COUNTER-Guard, in fortification, is a work raised before the point of a bastion, consisting of too long faces parallel to the faces of the bastion, making a salient angle: they are sometimes of other shapes, or otherwise situated.

COUNTER-Light, or **Counter-jour**, a light opposite to any thing, which makes it appear to disadvantage. A single counter-light is sufficient to take away all the beauty of a fine painting.

COUNTER-March, in military affairs, a change of the face or wings of a battalion, by which means those that were in the front come to be in the rear. It also signifies returning, or marching back again.

COUNTER-Mine, in war, a well and gallery drove and sunk till it meet the enemy's mine to prevent its effect.

COUNTER-Paled, in heraldry, is when the escutcheon is divided into twelve pales parted per fesse, the two colours being counter-changed; so that the upper are of one colour, and the lower of another.

COUNTER-Part, in music, denotes one part to be applied to another. Thus the bass is said to be a counter-part to the treble.

COUNTER-Passant, in heraldry, is when two lions are in a coat of arms, and the one seems to go quite the contrary way from the other.

COUNTER-Point, in music: a term derived from the Latin preposition *contra*, and the verb *pungere*; because the musical characters by which the notes in each part are signified are placed in such a manner each with respect to each as to shew how the parts answer one another. See *COMPOSITION*.

COUNTER-Pointed, (*Contre-pointé*), in heraldry, is when two chevrons in one escutcheon meet in the points, the one rising as usual from the base, and the other inverted falling from the chief; so that they are counter to one another in the points. They may also be counter-pointed when they are founded upon the sides of the shield, and the points meet that way, called *counter-pointed in fesse*.

COUNTERPOISE, in the manage, is the liberty of the action and feat of a horse-man; so that in all the motions made by the horse, he does not incline his body more to one side than to the other, but continues in the middle of the saddle, being equally on his stirrups, in order to give the horse the proper and seasonable aids.

COUNTER-POTENT, (*Contre-potencé*), in heraldry, is reckoned a fur as well as vair and ermine; but composed of such pieces as represent the tops of crutches, called in French *potences*, and in old English *potents*.

COUNTER-

county.
county.

COUNTER-Proof, in rolling-press printing, a print taken off from another fresh printed; which by being passed through the press, gives the figure of the former, but inverted. To counter-prove, is also to pass a design in black lead, or red chalk, through the press, after having moistened with a sponge both that and the paper on which the counter-proof is to be taken.

COUNTER-Quartered, (*contre-ecartelé*), in heraldry, denotes the escutcheon, after being quartered, to have each quarter again divided into two.

COUNTER-Salient, is when two beasts are borne in a coat leaping from each other directly the contrary way.

COUNTER-Scarp, in fortification, is properly the exterior talus or slope of the ditch; but it is often taken for the covered way and the glacis. In this sense we say, the enemy have lodged themselves on the counter-scarp. *Angle of the Counter-scarp*, is that made by two sides of the counter-scarp meeting before the middle of the curtain.

COUNTER-Signing, the signing the writing of a superior in quality of secretary. Thus charters are signed by the king, and counter-signed by a secretary of state, or lord chancellor.

COUNTER-Time, in the menage, is the defence or resistance of a horse that interrupts his cadence, and the measure of his menage, occasioned either by a bad horseman, or by the malice of the horse.

COUNTER, is also the name of a counting-board in a shop, and of a piece of metal with a stamp on it, used in playing at cards.

COUNTER of a Horse, that part of a horse's forehead which lies between the shoulders and under the neck.

COUNTERS in a Ship, are two. 1. The hollow arching from the gallery to the lower part of the straight piece of the stern, is called the *upper-counter*. 2. The lower-counter is between the transom and the lower part of the gallery.

COUNTER, is also the name of two prisons in the city of London, *viz.* the Poultry and Woodstreet.

COUNTY, among geographers, is used indifferently to denote either a kingdom, province, or lesser district. But its most frequent use is in contradistinction to town.

COUNTY, in geography, originally signified the territory of a count or earl, but now it is used in the same sense with **SHIRE**.

COUNTY-Court, in English law, a court incident to the jurisdiction of the sheriff. It is not a court of record, but may hold pleas of debt or damages under the value of 40s. Over some of which causes these inferior courts have, by the express words of the statute of Gloucester, a jurisdiction totally exclusive of the king's superior courts. For in order to be entitled to sue an action of trespass for goods before the king's justices, the plaintiff is directed to make affidavit that the cause of action does really and *bona fide* amount to 40s. which affidavit is now unaccountably disused, except in the court of exchequer. The statute also 43 Eliz. c. 6. which gives the judges in many personal actions, where the jury assess less damages than 40s. a power to certify the same and abridge the plaintiff of his full costs, was also meant to pre-

vent vexation by litigious plaintiffs; who, for purposes of mere oppression, might be inclined to institute such suits in the superior courts for injuries of a trifling value. The county-court may also hold plea of many real actions, and of all personal actions to any amount, by virtue of a special writ called a *justicies*; which is a writ empowering the sheriff for the sake of dispatch to do the same justice in his county-court, as might otherwise be had at Westminster. The freeholders of the county are the real judges in this court, and the sheriff is the ministerial officer. The great conflux of freeholders, which are supposed always to attend at the county-court, (which Spelman calls *forum plebeie justitie et theatrum comitatus potestatis*), is the reason why all acts of parliament at the end of every session were wont to be there published by the sheriff; why all outlawries of absconding offenders are there proclaimed; and why all popular elections which the freeholders are to make, as formerly of sheriffs and conservators of the peace, and fill of coroners, verderors, and knights of the shire, must ever be made in *pleno comitatu*, or, in full county-court. By the statute 2 Edw. VI. c. 25. no county-court shall be adjourned longer than for one month, consisting of 28 days. And this was also the ancient usage, as appears from the laws of king Edward the elder: "*prepositus* (that is, the sheriff) *ad quartam circiter septimanam frequentem populi concionem celebrato; cuique jus dicito; litesque singulas dirimito.*" In those times the county-court was a court of great dignity and splendor, the bishop and the alldorman (or earl) with the principal men of the shire sitting therein to administer justice both in lay and ecclesiastical causes. But its dignity was much impaired, when the bishop was prohibited, and the earl neglected to attend it. And, in modern times, as proceedings are removable from hence into the king's superior courts, by writ of *pone* or *recordare*, in the same manner as from hundred-courts, and courts-baron; and as the same writ of false judgment may be had, in nature of a writ of error; this has occasioned the same disuse of bringing actions therein.

COUPAR, the name of two towns of Scotland, the one situated about 12 miles north-east of Perth, in the shire of Angus, W. Long. 3. 0. N. Lat. 56. 30.; and the other in the county of Fife, about 10 miles west of St Andrews: W. Long. 2. 40. N. Lat. 56. 20.

COUPED, in heraldry, is used to express the head, or any limb, of an animal, cut off from the trunk, smooth; distinguishing it from that which is called *crasped*, that is, forcibly torn off, and therefore is ragged and uneven.

COUPED, is also used to signify such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUPLE-CLOSS, in heraldry, the fourth part of a chevron, never borne but in pairs, except there be a chevron between them, faith Guillim, though Bloom gives an instance to the contrary.

COUPLET, a division of a hymn, ode, song, &c. wherein an equal number, or equal measure, of verses is found in each part; which divisions, in odes, are called *strophes*.—**Couplet**, in an abuse of the word, is frequently made to signify a couple of verses.

Couped
Couplet.

COURAP, the modern name for a distemper very common in Java and other parts of the East-Indies. It is a sort of herpes or itch on the arm-pits, groins, breast, and face: the itching is almost perpetual; and the scratching is followed by great pain, and a discharge of matter, which makes the linen stick to the skin as not easily to be separated without tearing off the crust. *Courap* is a general name for any sort of itch; but this distemper is thus called by way of eminence. It is so contagious that few escape it. For the cure, gentle and repeated purging is used, and externally the sublimate in a small quantity is a good topic.

COURIER, a messenger sent post, or express, to carry dispatches.

COURLAND, a duchy situated between E. Long. 21. 26. and between N. Lat. 56. 30. and 57. 30. It is bounded by the river Dwina, which divides it from Livonia, on the north; by Lithuania, on the east; by Samogitia, on the south; and by the Baltic sea on the west; being 130 miles long, and 30 broad.

COURSE, (*fronts*), in navigation, the angle contained between the nearest meridian and that point of the compass upon which a ship sails in any particular direction.

COURSES, a name by which the principal sails of a ship are distinguished, *viz.* the main-sail, the fore-sail, and the mizen: the mizen-stay-sail and fore-sail are also sometimes comprehended in this denomination; as are the main-stay-sails of all brigs and schooners. See *SAIL*.

COURSING. There are three several sorts of courfes with gre-hounds: 1. At the hare; 2. At the fox; and, 3. At the deer.

For the *deer*, there are two sorts of courfes; the one in the paddock, the other either in the forest or the park. For the paddock courfe, there must be the gre-hound and the terrier, and the mongrel gre-hound, whose business it is to drive away the deer before the gre-hounds are slipped; a brace or a leash are the usual number slipped at a time, seldom at the utmost more than two brace. In courfing the deer in the forest, or park, there are two ways in use: the one is courfing from wood to wood; and the other, upon the lawns close by the keeper's lodge. In the courfing from wood to wood, the way is to throw in some young hounds into the wood to bring out the deer; and if any deer come out that is not weighty, or a deer or antler which is buck, fore, or sorrel, then you are not to slip your gre-hounds, which are held at the end of the wood, where the keepers, who can guess very well on these occasions, expect that the deer will come out. If a proper deer come out, and it is suspected that the brace or leash of gre-hounds slipped after him will not be able to kill him, it is proper to waylay him with a couple of fresh gre-hounds.

The courfing upon the lawn is the most agreeable of all other ways. When the keeper has notice of this, he will lodge a deer for the courfe; and then, by coming under the wind, the gre-hound may be brought near enough to be slipped for a fair courfe.

The best method of courfing the *hare*, is to go out and find a hare sitting; which is easily done in the

summer, by walking across the lands, either stubble, fallow, or corn grounds, and casting the eye up and down: for in summer they frequent those places for fear of the ticks, which are common in the woods at that season; and in autumn the rains falling from the trees offend them. The rest of the year there is more trouble required; as the bushes and thickets must be beat to rouse them, and oftentimes they will lie so close, that they will not stir till the pole almost touches them: the sportsmen are always pleased with this, as it promises a good courfe. If a hare lies near any close or covert, and with her head that way, it is always to be expected that she will take to that immediately on being put up; all the company are therefore to ride up and put themselves between her and the covert before she is put up, that she may take the other way, and run upon open ground. When a hare is put up, it is always proper to give her ground, or *law*, as it is called; that is, to let her run 12 score yards, or thereabouts, before the gre-hounds are slipped at her; otherwise she is killed too soon, the greater part of the sport is thrown away, and the pleasure of observing the several turnings and windings that the creature will make to get away is all lost. A good sportsman had rather see a hare save herself after a fair courfe, than see her murdered by the gre-hounds as soon as she is up.

In courfing the *fox*, no other art is required, than standing close, and in a clear wind, on the outside of some grove where it is expected he will come out; and when he is come out, he must have head enough allowed him, otherwise he will return back to the covert. The slowest gre-hound will be able to overtake him, after all the odds of distance necessary; and the only danger is the spoiling the dog by the fox, which too frequently happens. For this reason, no gre-hound of any value should be run at this courfe; but the strong, hard, bitter dogs, that will seize any thing.

The laws of courfing established by the duke of Norfolk, and other sportsmen of the kingdom of England, are these:

1. He that is chosen sewerer, or letter loose of the dogs, shall receive the gre-hounds matched to run together into his leash, as soon as he comes into the field; he is to march next to the hare-finder, or him who is to start the hare, until he come to the form; and no horseman or footman is to go before or sideways, but all straight behind, for the space of about 40 yards.
2. A hare ought never to be courfed with more than a brace of gre-hounds.
3. The hare-finder is to give the hare three shoes before he puts her up from her form or seat, to the end that the dogs may be prepared and attend her starting.
4. If there be not a particular danger of losing the hare, she should have about twelve score yards law.
5. The dog that gives the first turn, if after that there be neither cote, slip, nor wrench, wins the wager.
6. A go-by, or bearing the hare, is accounted equivalent to two turns.
7. If neither dog turns the hare, he that leads to the last covert wins.
8. If any dog turns the hare, serves himself, and turns her again, it is as much as a cote, and a cote is esteemed as much as two turns.
9. If all the courfe be equal, he that bears

Court.

the hare shall win; and if he be not borne, the course shall then be judged *dead*. 10. If a dog take a fall in his course, and yet perform his part, he may challenge the advantage of a turn more than he gave. 11. If a dog turn the hare, serve himself, and give divers cotes, and yet in the end shall stand still in the field, the other dog, if he turns home to the covert, although he gives no other, shall be adjudged to win the wager. 12. If by misfortune a dog be rid over in the course, that course shall be adjudged void, and he that did the mischief is to make reparation to the owner. 13. If a dog gives the first and last turn, and there be no other advantage betwixt them, he that gives the odd turn wins. 14. A cote is when a greyhound goes end-ways by the side of his fellow, and gives the hare a turn. 15. A cote serves for two turns, and two trippings or jerkings for a cote; and if the hare turns not quite about, the only *wrencheth*, in the sportsman's phrase. 16. If there be no cotes given by either of the greyhounds, and one serves the other at turning, then he that gives the most turns wins the wager. 17. Sometimes a hare does not turn, but wrenches; for she does not turn, except she turn as it were round. In these cases, two wrenches stand for one turn. 18. He that comes in first at the death of the hare takes her up, and saves her from breaking; he cherishes the dogs, and cleanses their mouths from the wool; he is adjudged to have the hare for his pains. 19. Finally, those who are judges of the leash, must give their judgement before they depart out of the field, or else it is not to stand as valid.

COURT, an appendage to a house or habitation; consisting of a piece of ground inclosed with walls, but open upwards.

COURT is also used for the palace, or place where a king or sovereign prince resides.

COURT, in a law-sense, is defined to be a place wherein justice is judicially administered. And, as by our excellent constitution the sole executive power of the laws is vested in the person of the king, it will follow that all courts of justice, which are the medium by which he administers the laws, are derived from the power of the crown. For whether created by act of parliament, or letters patent, or subsisting by prescription, (the only methods by which any court of judicature can exist), the king's consent in the two former is expressly, and in the latter impliedly, given. In all these courts, the king is supposed in contemplation of law to be always present; but as that is in fact impossible, he is there represented by his judges, whose power is only an emanation of the royal prerogative.

For the more speedy, universal, and impartial administration of justice between subject and subject, the law hath appointed a prodigious variety of courts, some with a more limited, others with a more extensive jurisdiction; some constituted to inquire only, others to hear and determine; some to determine in the first instance, others upon appeal and by way of review. See *LAW*, n^o xcvi. xcix. c. cxli. clvi. clvii. clviii. and the respective articles in the order of the alphabet. One distinction may be here mentioned, that runs throughout them all; viz. that some of them are courts of *record*, others *not of record*. A court of record is that where the acts and judicial proceedings are

enrolled in parchment for a perpetual memorial and testimony: which rolls are called the records of the court, and are of such high and supereminent authority, that their truth is not to be called in question. For it is a settled rule and maxim, that nothing shall be averred against a record, nor shall any plea, or even proof, be admitted to the contrary. And if the existence of a record be denied, it shall be tried by nothing but itself; that is, upon bare inspection whether there be any such record or no; else there would be no end of disputes. But, if there appear any mistake of the clerk in making up such record, the court will direct him to amend it. All courts of record are the king's courts, in right of his crown and royal dignity, and therefore no other court hath authority to fine or imprison; so that the very erection of a new jurisdiction with power of fine or imprisonment makes it instantly a court of record.—A court not of record is the court of a private man; whom the law will not intrust with any discretionary power over the fortune or liberty of his fellow-subjects. Such are the courts-baron incident to every manor, and other inferior jurisdictions: where the proceedings are not enrolled or recorded; but as well their existence as the truth of the matters therein contained shall, if disputed, be tried and determined by a jury. These courts can hold no plea of matters cognizable by the common law, unless under the value of 40s.; nor of any forcible injury whatsoever, not having any process to arrest the person of the defendant.

In every court there must be at least three constituent parts, the *actor*, *reus*, and *judex*: the *actor*, or plaintiff, who complains of an injury done; the *reus*, or defendant, who is called upon to make satisfaction for it; and the *judex*, or judicial power, which is to examine the truth of the fact, to determine the law arising upon that fact, and, if any injury appears to have been done, to ascertain and by its officers to apply the remedy. It is also usual in the superior courts to have attorneys, and advocates or counsel, as assistants. See *ATTORNEY*, and *COUNSEL*.

COURT-BARON, in English law, a court incident to every manor in the kingdom, to be held by the steward within the said manor. This court-baron is of two natures: the one is a customary court, appertaining entirely to the copyholders, in which their estates are transferred by surrender and admittance, and other matters transacted relative to their tenures only. The other is a court of common law, and it is the court of the *barons*, by which name the freeholders were sometimes anciently called: for that it is held before the freeholders who owe suit and service to the manor, the steward being rather the registrar than the judge. These courts, though in their nature distinct, are frequently confounded together. The court we are now considering, viz. the freeholder's court, was composed of the lord's tenants, who were the *pares* of each other, and were bound by their feudal tenure to assist their lord in the dispensation of domestic justice. This was formerly held every three weeks; and its most important business is to determine, by writ of right, all controversies relating to the right of lands within the manor. It may also hold plea of any personal actions, of debt, trespass on the case, or the like,

like, where the debt or damages do not amount to 40s. Which is the same sum, or three marks, that bounded the jurisdiction of the ancient Gothic courts in their lowest instance, or *ferding-courts*, so called because four were instituted within every superior district or hundred. But the proceedings on a writ of right may be removed into the county-court by a precept from the sheriff called a *tolt*, "*quia tollit atque eximit causam e curia baronum*." And the proceedings in all other actions may be removed into the superior courts by the king's writs of *pone*, or *accedas ad curiam*, according to the nature of the suit. After judgment given, a writ also of *false judgment* lies to the courts at Westminster to rehear and review the cause, and not a writ of *error*; for this is not a court of record: and therefore, in some of these writs of removal, the first direction given is to cause the plaintiff to be recorded, *recordari facias loquissam*.

Baron-Court, in Scots law. See **LAW**, n° clviii. 12. 13, 14.

Court-Martial, a court appointed for the punishing offences in officers, soldiers, and sailors, the powers of which are regulated by the mutiny-bill.

COURTESY, or **CURTSEY**, of *England*; a certain tenure whereby a man marrying an heiress seized of lands of fee-simple, or fee-tail general, or seized as heir of the tail special, and getteth a child by her that cometh alive into the world, though both it and his wife die forthwith; yet, if she were in possession, he shall keep the land during his life, and is called *tenant per legem Anglie*, "or tenant by the courtesy of England;" because this privilege is not allowed in any country except Scotland, where it is called *curialitas Scotie*.

COURTESAN, a woman who prostitutes herself for hire, especially to people of superior rank. *Lais*, the famous Theban courtesan, stands on record for requiring no less than 10,000 crowns for a single night. Of all places in the world, Venice is that where courtesans abound the most. It is now 300 years since the senate, which had expelled them, was obliged to recall them; to provide for the security of women of honour, and to keep the nobles employed lest they should turn their heads to make innovations in the state.

COURTRAY, a town of the Austrian Netherlands, situated on the river Lys, about 23 miles south-west of Ghent, and fourteen east of Ypres. E. Long. 3. 10. N. Lat. 50. 48.

COUSIN, a term of relation between the children of brothers and sisters, who in the first generation are called cousin-germans, in the second generation second-cousins, &c. If sprung from the relations of the father's side, they are denominated *paternal* cousins; if on the mother's, *maternal*.

COUSIN (John), a celebrated French painter, who excelled in painting on glass. His picture of the last judgment, in the vestry of the Minims of the Wood of Vincennes, is much admired. He was also a good sculptor. He wrote several works on geometry and perspective; and died after the year 1689.

COSU, in heraldry, signifies a piece of another colour or metal placed on the ordinary, as if it were sewed on, as the word imports. This is generally of colour upon colour, or metal upon metal, contrary to the general rule of heraldry.

COVERT, in heraldry, denotes something like a piece of hanging, or a pavilion falling over the top of a chief or other ordinary, so as not to hide, but only to be a covering to it.

COW, in zoology. See **BOS**.

Sea-Cow, in zoology. See **TRICHECTS**.

Cow-Itch, or **Couage**, in botany. See **DOLICHOS**.

Cow's-Lip, in botany. See **PRIMULA**.

COWARD, in heraldry, a term given to a lion borne in an escutcheon with his tail doubled or turned in between his legs.

COWEL (Dr John), a learned and eminent civilian, born about the year 1554. In 1607 he compiled a *Law Dictionary*, which gave great offence to Sir Edward Coke and the common lawyers; so that they first accused him to James I. as asserting that the king's prerogative was in some cases limited; and when they failed in that attempt, they complained of him to the house of commons, as a betrayer of the rights of the people, by asserting that the king was not bound by the laws: for which he was committed to custody, and his book publicly burnt. He also published *Institutiones Juris Anglicani*, in the manner of Justinian's Institutes: and died of the operation for the stone, in 1611.

COWES, a town and harbour on the north-east coast of the Isle of Wight, in Hampshire. It has no market, but is the best place for trade in the whole island; but as it lies low, the air is accounted unhealthy. It is eight miles south-east of Portsmouth. W. Long. 1. 25. N. Lat. 50. 45.

COWL, or **COUL**, a habit worn by the Bernardines and Benedictines, of which there are two kinds; one white, very large, worn in ceremonies; the other black, worn on ordinary occasions, in the streets, &c.

Friar's Cowl, in botany. See **ARISARUM**.

COWLEY (Abraham), was born at London 1618. His father, who was a grocer, dying before he was born, his mother procured him to be admitted a king's scholar at Westminster. His first inclination to poetry arose on his lighting on Spenser's *Fairy Queen*, when he was but just able to read: and this inclination so far improved in him, that at 13 he began to write several poems; a collection of which was published in 1613, when he was but 15. But one thing extremely remarkable in him was, that with so extraordinary a natural genius, he had so bad a memory that his teachers could never bring him to retain even the common rules of grammar. So that he not formed the most intimate acquaintance with the books themselves from which these rules are drawn, he could never have been master of them. In 1636 he was elected a scholar of Trinity College, Cambridge, and removed to that university. Here he went thro' all his exercises with a remarkable degree of reputation; and at the same time must have pursued his poetical turn with great eagerness, as it appears that the greatest part of his poems were written before he left that university. He had taken his degree of Master of Arts before 1643, when, in consequence of the turbulence of the times, he, among many others, was ejected from the college: whereupon, retiring to Oxford, he entered himself of St John's college; and that very year, under the denomination of a *scholar*

Cowert
|
Cowley.

lar of Oxford, published a satire called *The Puritan and the Papist*. It is apparent, however, that he did not remain very long at Oxford: for his zeal to the royal cause engaging him in the service of the king, who was very lenient of his abilities, and by whom he was frequently employed, he attended his majesty in many of his journeys and expeditions, and gained not only that prince's esteem, but that of many other great personages, and in particular of lord Falkland, one of the principal secretaries of state.

During the heat of the civil war, he was settled in the earl of St Alban's family; and when the queen-mother was obliged to retire into France, he accompanied her thither, laboured strenuously in the affairs of the royal family, undertook several very dangerous journeys on their account, and was the principal instrument in maintaining an epistolary correspondence between the king and queen.

In the year 1636 it was judged proper that Mr Cowley should come over into England, and, under pretence of privacy and retirement, give notice of the situation of affairs in that kingdom to those by whom he was employed. Soon after his arrival, however, he was seized, in the search after another gentleman of considerable note in the king's party: but although it was through mistake that he was taken, yet when the republicans found all their attempts of every kind to bring him over to their party proved ineffectual, he was committed to a severe confinement, and it was even with considerable difficulty that he obtained his liberty: when, venturing back to France, he remained there, in his former situation, till near the time of the king's return.

Soon after the restoration he became possessed of a very competent estate, through the favour of his principal friends the duke of Buckingham and the earl of St Albans; and being now upwards of 40 years of age, he took up a resolution to pass the remainder of a life which had been a scene of tempest and tumult, in that situation which had ever been the object of his wishes, a studious retirement. His eagerness to get out of the bustle of a court and city made him less careful than he might have been in the choice of a healthful habitation in the country; by which means he found his solitude from the very beginning suit less with the constitution of his body than with his mind. His first rural residence was at *Barn Elms*, a place, which lying low, and being near a large river, was subject to a variety of breezes from land and water, and liable in the winter-time to great inconvenience from the dampness of the soil. The consequence of this Mr Cowley too soon experienced, by being seized with a dangerous and lingering fever. On his recovery from this, he removed to Chertsey, a situation not much more healthy, where he had not been long before he was seized with another consuming disease. Having languished under this for some months, he at length got the better of it, and seemed pretty well recovered from the bad symptoms; when one day in the heat of summer 1667, staying too long in the fields to give some directions to his labourers, he caught a most violent cold, which was attended with a defluxion and stoppage in his breast; and for want of timely care, by treating it as a common cold,

and refusing advice till it was past remedy, he departed this life on the 28th of July in that year, being the 49th of his age; and, on the 3^d of August following, he was interred in Westminster-abbey, near the ashes of Chaucer and his beloved Spencer. He was a man of a very amiable character, as well as an admirable genius. King Charles II. on the news of his death, declared "that Mr Cowley had not left a better man behind him in England." A monument was erected to his memory by George Villiers duke of Buckingham in 1675.

COX (Richard), a learned prelate, and principal pillar of the Reformation, was born at Whaddon in Buckinghamshire, of low parentage, in the year 1499. From Eaton school he obtained a scholarship in King's college in Cambridge, of which he became a fellow in 1519: he was thence invited to Oxford by cardinal Woolsey, and was there made one of the *junior* canons of Cardinal College. In 1525 he was incorporated Bachelor; and the following year took the degree of Master of Arts in the same university. In this situation he became remarkable for his learning and poetical abilities; but his attachment to the opinions of Luther rendered him hateful to his superiors, who stripped him of his preferment, and threw him into prison, on a suspicion of heresy. Being, however, soon released, he was chosen master of Eaton school, which flourished remarkably under his care. In 1537, he commenced Doctor of Divinity at Cambridge; in 1540, was made archdeacon of Ely; and the following year prebendary of that cathedral, on its being new founded by king Henry VIII. In 1546, he was made dean of Christ-church, Oxford. By the recommendation of archbishop Crammer and bishop Goodrich, to the latter of whom he had been chaplain, he not only obtained the above preferments, but was chosen preceptor to prince Edward; on whose accession to the throne he became a favourite at court, was sworn of the privy council, and made king's almoner. In 1547, he was elected chancellor of Oxford; in 1548, canon of Windsor; and the next year, dean of Westminster. About this time he was appointed one of the commissioners to visit the university of Oxford; in which office his zeal for reformation was so excessive, that he destroyed a number of curious and valuable books, for no better reason than because they were written by Roman Catholics. On the accession of queen Mary he was stripped of all his preferments, and committed to the Marshalsea. He was, however, soon released, and immediately left the kingdom. Having resided some time at Strasburg with his intimate friend Pater Martyr, on the death of queen Mary he returned to England, and, with other divines, was appointed to revise the liturgy. He often preached before the queen; and, in 1559, was preferred to the see of Ely, which he continued to enjoy upwards of 21 years. He was, however, no favourite with the queen: the reason assigned for which was, his zealous opposition to her retaining the crucifix and wax-candles on the altar of the royal chapel; also his strenuous defence of the marriage of the clergy, which her majesty always disapproved. He died on the 22^d of July 1581, aged 81. He was a man of considerable learning, a zealous and rigid bulwark of the church

Woxwold
i
Crab.

of England, and an implacable enemy both to Papists and Puritans. In a letter to archbishop Parker he advises him to proceed vigorously in reclaiming or *purifying* the Puritans, and not to be discouraged at the frown of those court-favourites who protected them; assuring him that he might expect the blessing of God on his *pious* labours to free the church from their dangerous attempts, and to establish uniformity.—This zealous reformer we find had not totally lost sight of the popish text, *compel them to come in*: but a stronger proof of his implacability and self-importance appears in his letter to the lord treasurer Burleigh, in which he warmly expostulates with the council for interposing in behalf of the Puritans, or meddling in affairs of the church, admonishing them to keep their own sphere. Such language from a bishop would make a modern privy council stare. His works are, 1. Two Latin Orations on the Dispute between Dr Tresham and Peter Martyr, Lond. 1549, 4^{to}. 2. Liturgy of the Church of England; in compiling, and afterwards correcting which, he was principally concerned. 3. The Lord's Prayer in verse, commonly printed at the end of David's Psalms by Sternhold and Hopkins. 4. Translation of the four Gospels, the Acts of the Apostles, and the Epistle to the Romans, in the new translation of the Bible in the reign of queen Elizabeth. 5. Resolutions of some Questions concerning the Sacrament, in the Collection of Records at the end of Burnet's History of the Reformation. 6. Several Letters to the Queen and others, published in Strype's Annals of the Reformation. He is also said to have been concerned in the declaration concerning the divine institution of bishops, and to have assisted Lile in his Grammar.

COXWOLD, a town in the North-riding of Yorkshire, 14 miles north of York. W. Long. 1. 10. N. Lat. 54. 16.

COYPEL (Anthony), an excellent French painter, born at Paris in 1661. Noel Coypel, his father, being chosen by M. Colbert to be director of the academy at Rome, he took his son with him into Italy, where Anthony Coypel formed himself on the works of the greatest masters, and on his return to France was made first painter to the duke of Orleans. That prince employed him in painting the grand gallery of the royal palace, and allowed him a pension. In 1714, he was director of the Academy of Painting and Sculpture. In 1715, he was made first painter to the French king, and was ennobled on account of his merit. He died in 1722. M. Coypel, his son, also excelled in the same art.

COZENING; tricking, or defrauding.—In law, it denotes an offence where any thing is done deceitfully, whether belonging to contracts or not, which cannot be properly termed by any special name.

COZUMEL, an island near the western coast of Yucatan, where Cortez landed and refreshed his troops, before entering upon the conquest of Mexico: W. Long. 89. 0. and N. Lat. 13. 0.

CRAB, in zoology. See CANCEL.

CRAB'S *Claws*, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the black part, so much of the extremity of the claws only being allowed to be used in medicine

as is tinged with this colour. The blackness, however, is only superficial; they are of a greyish white within, and when levigated furnish a tolerable white powder.

CRAB'S claws are of the number of the alkaline absorbents, but they are superior to the generality of them in some degree, as they are found on a chemical analysis to contain a volatile urinous salt.

CRAB'S *Eyes*, in pharmacy, are a strong concretion in the head of the cray-fish. They are rounded on one side, and depressed and finuated on the other, considerably heavy, moderately hard, and without smell. We have them from Holland, Muscovy, Poland, Denmark, Sweden, and many other places.

CRAB'S eyes are much used both in the shop-medicines and extemporaneous prescriptions, being accounted not only absorbent and drying, but also diffusive and diuretic.

CRAB, a sort of wooden pillar, whose lower end, being let down through a ship's decks, rests upon a socket like the capstern; and having in its upper end three or four holes, at different heights, through the middle of it, one above another, into which long bars are thrust, whose length is nearly equal to the breadth of the deck. It is employed to wind in the cable, or to purchase any other weighty matter which requires a great mechanical power. This differs from a capstern, as not being furnished with a *drum-head*, and by having the bars to go entirely through it, reaching from one side of the deck to the other; whereas those of the capstern, which are superior in number, reach only about eight inches or a foot into the drum-head, according to the size thereof. This machine is represented in Plate LXVII. n^o 4. See also CAPSTERN.

CRAB-TAWS, a name in Jamaica for a kind of ulcer on the soles of the feet, with hard callous lips, so hard that it is difficult to cut them. The ungt. cerol. fort. is their cure.

CRACKER, or SEA-PHEASANT, in ornithology, the English name of the *anas acuta*. See ANAS.

CRACKS, in timber. See CLEFT.

CRACKOW, a city of Poland, situated in a palatinate of the same name, and by some accounted the capital of the whole kingdom. It stands at the conflux of the rivers Vistula and Redawa, in E. Long. 20. 16. N. Lat. 50. 8. It is very populous, and the largest and best built town in Poland. The inhabitants had the liberty of purchasing estates, and a voice in choosing the king, while Poland subsisted as an independent state. But the city is now much declined from what it was formerly, and its trade is become inconsiderable; yet it is full of gentry, and a wealthy clergy. The number of the religious houses in the town and suburbs is very great. Here is a castle of such an immense size as to resemble a town in its appearance. It contains the palace, the cathedral, and some other churches and houses; and is defended by walls, towers, and bastions. This was also the place of the king's coronation and burial, and in the cathedral were kept the regalia. The bishop of Cracow is the first in the kingdom, duke of Saveria, and very often a cardinal. His revenues are larger than those of his metropolitan the archbishop of Gelná, and are computed to amount to 40,000 dollars *per annum*. The cathedral is dedicated

Crab
i
Crackow.

cated to St Stanislaus, who was formerly bishop of this see; and was murdered by Boleslaus II. at the altar, because he took the liberty to admonish and reprove him; for which reason the king and nobles walked in procession to his shrine the day before the coronation, with a view to expiate the crime, and often made very costly offerings. Masses are said in this church day and night without intermission.

CRADLE, a well known machine in which infants are rocked to sleep.

It denotes also that part of the stock of a cross-bow where the bullet is put.

CRADLE, in surgery, a case in which a broken leg is laid after being set.

CRADLE, among shipwrights, a frame placed under the bottom of a ship, in order to conduct her smoothly and steadily into the water when she is going to be launched; at which time it supports her weight while she slides down the descent or sloping passage called the ways, which are for this purpose daubed with soap and tallow.

CRAFT, a general name for all sorts of vessels employed to load or discharge merchant ships, or to carry alongside or return the stores of men of war. Such are lighters, hoys, barges, prames, &c. See those articles.

CRAKE, or **CORN-CRAKE**. See **RALLUS**.

CRAIL, or **CAREIL**, a parliament town of Scotland, situated on the sea-coast of the county of Fife, about seven miles south-east of St Andrews. W. Long. 2. 20. and N. Lat. 56. 17.

CRAMBE, **SEA-CABBAGE**, **SEA-BEACH KALE**, or **SEA-COLEWORT**; a genus of the siliquosa order, belonging to the tetradynamia class of plants. There are three species, all of them herbaceous esculents with perennial roots, producing annually large leaves resembling those of cabbage spreading on the ground, with strong flower-stalks and yellowish flowers. Only one of the species is a native of Britain: it grows wild on the shores of many of the maritime counties of England, but is cultivated in many gardens as a choice esculent; and the young robust shoots of its leaves and flower-stalks, as they issue forth from the earth after the manner of asparagus shoots, are then in the greatest perfection for use. At this period they appear white as if blanched, and when boiled eat exceeding sweet and tender. Its principal season for use is in April and May. This plant may also be employed in the pleasure-ground as a flowering perennial, for the stalks divide into fine branchy heads of flowers. It is propagated by seeds sown in any common light earth in autumn or spring, where the plants are to remain, which, when two years old, will produce shoots fit for use, will multiply exceedingly by the roots, and continue for many years.

CRAMP, in medicine, a convulsive contraction of any muscular part of the body. It is commonly removed by stretching, and rubbing the part affected.

CRAMP-Fish, or **Torpedo**. See **RAJA**.

CRAMP-Iron, or **Cramps**, a piece of iron bent at

VOL. III.

each end, which serves to fasten together pieces of wood, stones, or other things.

CRAMPONEE, in heraldry, an epithet given to a cross which has at each end a cramp or square piece coming from it; that from the arm in chief towards the sinister angle, that from the arm on that side downwards, that from the arm in base towards the dexter side, and that from the dexter arm upwards.

CRANAGE, the liberty of using a crane at a wharf, and also the money paid for drawing up wares out of a ship, &c. with a crane.

CRANE, in ornithology. See **ARDEA**.

CRANE, in mechanics, a machine used in building commerce for raising large stones and other weights. See **MECHANICS**, n° 65.

CRANE's Bill, in botany. See **GERANIUM**.

CRANE-FLY, in zoology, a species of **TIPULA**.

CRANGANOR, a Dutch factory on the Malabar coast in the East Indies, seated in E. Long. 75. 5. N. Lat. 10. 0. See **COCHIN**.

CRANIOLARIA, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants. There are two species, both natives of hot climates, and neither of them possessed of any remarkable property.

CRANIUM. See **ANATOMY**, n° 10.

CRANMER (Thomas), a celebrated archbishop, reformer, and martyr, was the son of Thomas Cranmer, Esq; of Allacton in Nottinghamshire, where our author was born in 1489. At the age of 14, he was admitted a student of Jesus' college, Cambridge, of which he afterwards became fellow; but, marrying the relation of an inn-keeper's wife, he lost his fellowship, and quitted the college. On the death of his wife, he was re-admitted fellow of Jesus' college. In 1523, he took the degree of doctor of divinity, and was made theological lecturer and examiner. The plague being at Cambridge, he retired to the house of a relation at Waltham abbey, where, meeting with Fox the king's almoner, and Gardiner the secretary, he gave his opinion * concerning king Henry's marriage with Catharine, so much to the satisfaction of his majesty, that he sent for him to court, made him one of his chaplains, and ordered him to write in vindication of the divorce in agitation. This book having quieted the tender conscience of the king, he was desirous that all Europe should be convinced of the illegality of his marriage with queen Catharine; and for that purpose sent Cranmer to France, Italy, and Germany, to dispute the matter with the divines of those countries. At Nuremberg he married a second wife. Being returned to England, in March 1533, he was consecrated archbishop of Canterbury; in May following he pronounced the sentence of divorce between the king and queen, and soon after married the amorous monarch to Ann Boleyn. Being now at the head of the church, he exerted himself in the business of the reformation. The bible was translated into English, and monasteries dissolved principally by his means. In 1536 the royal conscience again required the assistance of our archbishop; in this year

13 L

* This opinion was, that instead of disputing about the validity of the king's marriage with Catharine, they should reduce the matter to this simple question, "Whether a man may marry his brother's wife or no?" When the king was told of it, he said, "This fellow has got the right sow by the ear."

Cranmy
↓
Crassula.

he divorced the king from Ann Boleyn; but, soon after, retuling his content in parliament to the appropriation of the dissolved monasteries to the sole use of the crown, he fell into disgrace, and retired from the business of the state. Nevertheless the king continued to protect him from his enemies; and at his death appointed him one of the executors of his will, and one of the regents of the kingdom. In 1546 he crowned young Edward, during whose short reign he promoted the reformation to the utmost of his power; and was particularly instrumental in compiling, correcting and establishing the liturgy by act of parliament. He had also a share in compiling the thirty-nine articles of religion. On the accession of queen Mary, the poor archbishop was accused of blasphemy, perjury, incontinency, and heresy. He defended himself with some resolution; but being degraded and most ignominiously treated, he was at last flattered and terrified into an insincere recantation, and renunciation of the protestant faith. But this triumph was not sufficient to gratify the pious vengeance of the Romish Mary*. Cranmer was condemned to the flames, and died a Protestant. He suffered at Oxford in the year 1556, in the 67th year of his age. As to his character, he was doubtless a man of learning, an indefatigable and sincere promoter of the reformation; nevertheless he wanted moderation and resolution. He wrote a great number of books: many of them he published himself; and many of them still remain in MSS. viz. two folio volumes in the king's library, several letters in the Cotton collection, &c.

CRANNY, in glass-making, an iron instrument wherewith the necks of glasses are formed.

CRANTOR, a Greek philosopher and poet, was born at Solos in Cilicia. He left his native country where he was admired; went to Athens, and there studied with Polemon under Xenocrates. He was considered as one of the chief supporters of the Platonic sect; and was the first who wrote commentaries upon Plato's works. He flourished 270 years before Christ.

CRAPE, in commerce, a kind of stuff, made in the manner of gauze, with raw silk, gummed and twisted on the mill.

CRAPULA, among physicians. See SURFEIT.

CRASIS, from *κρασις* to "mix;" the temper of the blood peculiar to every constitution.

CRASSAMENTUM, in phycic, the thick red or fibrous part of the blood, otherwise called *crudo*, in contradistinction to the serum or aqueous part.

CRASSULA, LESSER ORPINE, or LIVE-EVER; a genus of the pentagynia order, belonging to the pentandria class of plants. They are 17 species, all of them natives of warm climates. Several of them are cultivated in this country, but require the assistance of artificial heat for their preservation. They rise from

one foot to six or eight in height, and are ornamented with oblong, thick, succulent leaves, and funnel-shaped pentapetalous flowers of a scarlet, white, or greenish colour. They are propagated by off-sets or cuttings; and must be potted in light, sandy compost, retained in a sunny part of the green-house all winter, and very sparingly watered. In summer they may be placed in the full air in a sheltered place, and in dry weather watered twice a-week.

CRASSUS (Marcus), a Roman consul, enriched himself by trading in slaves: he was so wealthy, that he treated all Rome, and gave each citizen a stock of corn for three months. In the year of the city 668, he retired, from the tyranny of Cinna and Marius, to Spain, where Vibicus his friend hid him in a cave for eight months. From thence he went to Africa, where Sylla employed him; and he shewed extraordinary courage against the slaves under Spartacus, whom he defeated, and put those that fled to death. He was afterwards praetor, consul, and triumvir with Cæsar and Pompey. Joining Pompey, he entered Syria, plundered the temple of Jerusalem, and carried immense riches out of Judea. He at length marched against the Parthians; but his army, which was composed of about 100,000 men, was defeated, and himself killed, near Sinnaea, a city of Mesopotamia, in the fifty-third year before the Christian æra. It is said that his head being carried to Orodes king of the Parthians, that prince caused melted gold to be poured into his mouth, saying, that "he should be consumed by the flame metal, the insatiable desire of which had made him commit too many crimes."

CRATÆGUS, WILD-SERVICE TREE, HAWTHORN, &c. a genus of the digynia order, belonging to the icandria class of plants. There are nine species; all of the tree and shrub kind, hardy and deciduous; valuable for economical and ornamental purposes in gardening. They rise from 5 to 50 feet in height, adorned with simple leaves, in some divided, in others entire. Their flowers are of a white colour, pentapetalous, and appear in May and June, succeeded by bunches of red berries in autumn. They are raised abundantly from seeds in the full ground; and to continue the varieties, of which there are a great number distinct, they may be budded or grafted upon stocks of the common hawthorn; for all the sorts will readily take upon that stock or upon one another. The *bawis*, or berries of the hawthorn, never fail to ripen abundantly; and may easily be collected from the hedges and inclosures of fields in September and October; but all the sorts may be had cheap enough from the nursery-men; and the best time to sow them is soon after they are ripe; that is, in October or November, or very early in the spring, in beds of light earth, either broad-cast or in drills, and cover them an inch, or half an inch deep. But, as most of these seeds frequently

* There can be no doubt that her pious majesty was, from the first, determined to bring Cranmer to the stake; and her reason is obvious. If his being a Protestant had been his only crime, his recantation would have been sufficient. But she remembered him as the instrument of her mother's divorce, and this she could never forgive. For this crime even his death was an insufficient atonement. She determined first to make him renounce his religion, by flattering him with the assurance of pardon; by which diabolical policy she intended at once to humble the prelate, and triumph over the protestant cause. As to Cranmer's conduct on this occasion, some think he acted like a wise man. When the question was, *recant or burn*, he prudently chose the former; but when he found that he had been infamous deceived, and that his fate was inevitable, he repented of what he had done, and heroically thrust into the fire the hand which had signed his recantation. If his zeal had not overpowered his prudence, he would have left the kingdom when Mary came to the crown.

Cratches
|
Cratæva.

frequently remain in the ground till the second spring, it is therefore customary with many, previous to sowing, to bury them in a heap in a trench. This is to be done in a dry-lying land, and they will be all the while preparing for vegetation. If buried in October, November, or December, they may be suffered to remain in the ground for a whole year. If they are then sowed as above directed, they will all mostly come up the spring after; though it is observed, that those sowed at once in the beds an inch or two deep, generally come up freely the second spring after sowing, and most commonly shoot stronger and more regular than when the other method is followed.

CRATCHES, in the menage, a swelling on the paster, under the fetlock, and sometimes under the hoof; for which reason it is distinguished into the sinew cratches, which affect the sinew, and those upon the coronet, called *quitter-bones*.

CRATER, in astronomy, the name of a constellation. See **ASTRONOMY**, n° 206.

CRATER is also used to signify the mouth or opening of a volcano or burning mountain, from whence the fire is discharged. See **VOLCANO**.

CRATES, of Thebes, a famous philosopher, was the disciple of Diogenes the Cynic. It is said that he threw all his money into the sea, that he might the more freely apply himself to the study of philosophy. Others assert that he placed it in another person's hands, with orders to give it to his children if they should happen to be fools: For, (said Crates), if they should be philosophers, they will have no need of it: in which case it was to be given to the people. He flourished about 328 years before Christ.

He ought not to be confounded with Crates, a famous academic philosopher, the disciple and friend of Polemon. This last Crates had Arcesilaus and other celebrated philosophers for his disciples; and flourished about 300 years before Christ.

CRATEVA, the **GARLIC PEAR**; a genus of the monogynia order, belonging to the polyandria class of plants. There are two species, both of them natives of several parts of India. They are both of the tree kind; and are chiefly distinguished by their fruit. The tapia, or garlic pear, has a smooth round fruit about the size of an orange, with a hard brown shell or cover, which incloses a mealy pulp, filled with kidney-shaped seeds. It hath a strong smell of garlic, and communicates the same to such animals as feed upon it. The tender buds from the young branches being bruised and applied to the naked skin, will blister as effectually as cantharides. It rises to the height of about 30 feet. The other grows to the size of a very large tree, with trifoliate leaves, sowed on the edges. The flowers have the smell of roses, and are succeeded by an oblong fruit of the size of an apple, covered with a very hard bony shell, and containing a soft fleshy pulp, having the taste of quinces. From the flowers of this plant is obtained by distillation a

water highly odoriferous and cordial. The pulpy part of the fruit is prepared into various kinds of marmalades, which are exceedingly agreeable to the taste, and are much used by the *graudes* in those countries where the trees are native; they are also reckoned serviceable in dysenteries. Both species may be propagated in this country by seeds. These are to be sown upon a hot-bed in the spring; and when the plants come up, they are to be treated in the manner directed for the **ANNONA**.

CRATINUS, an ancient comic poet, of whom we detect scarcely have known any thing, had not Quintilian, Horace, and Perlius, mentioned him, Eupolis, and Aristophanes, as the great masters of what we call the ancient comedy. It is gathered that he died in the 87th Olympiad. Suidas tells us that he wrote 21 plays, and that he was splendid and bright in his characters.

CRATIPPUS, a celebrated peripatetic philosopher, was a native of Mitylene, where he taught philosophy; but at length went to Athens, where Brutus and the son of Cicero, were his disciples. Pompey went to see him after the battle of Pharsalia, and proposed to him his difficulties in relation to the belief of a providence; when Cratippus comforted him, and by forcible arguments answered his objections.

CRATO, a small town of Portugal, in the province of Alentejo, with a rich priory. It is the chief commandery which the knights of Malta have in Portugal. W. Long. 8. 12. N. Lat. 38. 50.

CRAVAN, a town of France, in Burgundy, remarkable for its good wine, and for a battle fought there between the English and French. It is seated near the confluence of the rivers Cure and Yonne. E. Long. 3. 30. N. Lat. 47. 42.

CRAVEN, or **CRAYENT**, a word of reproach, used in trials by battle. See **BATTEL**.

CRAX, in ornithology, a genus of birds, belonging to the order of gallinæ. The base of the beak of each mandible is covered with wax; and the feathers of the head are curled. There are five species, *viz.* 1. The aleator, or Indian hen of Sloane, is about the size of a common hen. It is black, with a white belly. A yellow wax covers about one half of each mandible; the tongue is entire; the temples are bare and black; the tail is roundish, and consists of 14 prime feathers; and it has no spur. It is found in the warm parts of America. 2. The rubra, or Peruvian hen, is red, with a bluish head: it is a native of Peru. 3. The mitu, or Brazilian pheasant, is black, with a dusky belly, and red wax: it is a native of Guinea and Brazil. 4. The globicera, has a yellow protuberance between the nostrils, and is of a bluish-black colour: it is likewise a native of Brazil. 5. The pauxi, or Mexican pheasant of Brissonius, is of a bluish colour, with blue wax, and the tip of the tail and belly white: it is a native of Mexico.

CRAY-FISH, or **CRAW-FISH**. See **CANCER**.

Cratinus

Cray.

C R A Y O N - P A I N T I N G .

PASTILS, or **CRAYONS**, are compositions of colours, which are reduced to the texture of chalk,

and used dry in the form and manner of pencils, for painting on paper.

Whether the painter works with oil-colours, water-colours, or crayons, the grand object of his pursuit is still the same: a just imitation of nature. But each species has its peculiar rules and methods.—Painting with crayons requires in many respects a treatment different from painting in oil-colours; because all colours used dry are, in their nature, of a much warmer complexion than when wet with oils, &c. For this reason, in order to produce a rich picture, a much greater portion of what painters term *cooling tints* must be applied in crayon-painting, than would be judicious to use in oils. Without any danger of a mistake, it is to be supposed, the not being acquainted with this observation is one great cause why so many oil-painters have no better success when they attempt crayon-painting. On the contrary, crayon-painters being so much used to those tints, which are of a cold nature when used wet, are apt to introduce them too much when they paint with oils, which is seldom productive of a good effect.

We shall now endeavour to give the student some directions towards the attainment of excellence in this art.

SECT. I. *Of the Application of the Crayons, with some previous Dispositions.*

THE student must provide himself with some strong blue paper, the thicker the better, if the grain is not too coarse and knotty, though it is almost impossible to get any entirely free from knots. The knots should be levelled with a penknife or razor, otherwise they will prove exceedingly troublesome. After this is done, the paper must be pasted very smooth on a linen cloth, previously strained on a deal frame, the size according to the artist's pleasure: on this the picture is to be executed; but it is most eligible not to paste the paper on till the whole subject is first dead-coloured. The method of doing this is very easy, by laying the paper with the dead-colour on its face, upon a smooth board or table, when, by means of a brush, the back-side of the paper must be covered with paste; the frame, with the strained cloth, must then be laid on the pasted side of the paper, after which turn the painted side uppermost, and lay a piece of clean paper upon it, to prevent smearing it; this being done, it may be stroked gently over with the hand; by which means all the air between the cloth and the paper will be forced out.

When the paste is perfectly dry, the student may proceed with the painting. The advantages arising from pasting the paper on the frame according to this method, after the picture is begun, are very great, as the crayons will adhere much better than any other way, which will enable the student to finish the picture with a firmer body of colour, and greater lustre.

When painters want to make a very correct copy of a picture, they generally make use of tiffany or black gauze, strained tight on a frame, which they lay flat on the subject to be imitated, and with a piece of sketching chalk, trace all the out-lines on the tiffany. They then lay the canvas to be painted on, flat upon the floor, placing the tiffany with the chalked lines upon it, and with an handkerchief brush the whole over; this presents the exact out-lines of the picture

on the canvas. The crayon-painter may also make use of this method, when the subject of his imitation is in oils; but in copying a crayon-picture, he must have recourse to the following method, on account of the glass.

The picture being placed upon the easel, let the out-lines be drawn on the glass with a small camel's hair pencil dipped in lake, ground thin with oils, which must be done with great exactness. After this is accomplished, take a sheet of paper of the same size and place it on the glass, stroking over all the lines with the hand, by which means the colour will adhere to the paper, which must be pierced with pin-holes pretty close to each other. The paper intended to be used for the painting must next be laid upon a table, and the pierced paper placed upon it; then with some fine-pounded charcoal, tied up in a piece of lawn, rub over the pierced lines, which will give an exact outline; but great care must be taken not to brush this off till the whole is drawn over with sketching chalk, which is a composition made of whiting and tobacco-pipe clay, rolled like the crayons, and pointed at each end.

When a student paints immediately from the life, it will be most prudent to make a correct drawing of the outlines on another paper, the size of the picture he is going to paint, which he may trace by the preceding method, because erroneous strokes of the sketching chalk (which are not to be avoided without great expertness) will prevent the crayons from adhering to the paper, owing to a certain greasy quality in the composition.

The student will find the sitting posture, with the box of crayons in his lap, the most convenient method for him to paint. The part of the picture he is immediately painting should be rather below his face; for, if it is placed too high, the arm will be fatigued. Let the windows of the room where he paints be darkened, at least to the height of six feet from the ground; and the subject to be painted should be situated in such a manner, that the light may fall with every advantage on the face, avoiding too much shadow, which seldom has a good effect in portrait painting, especially if the face he paints from has any degree of delicacy.

Before he begins to paint, let him be attentive to his subject, and appropriate the action or attitude proper to the age of the subject: if a child, let it be childish; if a young lady, express more vivacity than in the majestic beauty of a middle-aged woman, who also should not be expressed with the same gravity as a person far advanced in years. Let the embellishments of the picture, and introduction of birds, animals, &c. be regulated by the rules of propriety and consistency.

The features of the face being correctly drawn with chalks, let the student take a crayon of pure carmine, and carefully draw the nostril and edge of the nose, next the shadow, then, with the faintest carmine tint, lay in the highest light upon the nose and forehead, which must be executed broad. He is then to proceed gradually with the second tint, and the succeeding ones, till he arrives at the shadows, which must be covered brilliant, enriched with much lake, carmine, and

and deep green. This method will at first offensively strike the eye, from its crude appearance; but, in the finishing, it will be a good foundation to produce a pleasing effect, colours being much more easily sullied when too bright, than when the first colouring is dull, to raise the picture into a brilliant state. The several pearly tints discernable in fine complexions must be imitated with blue verditer and white, which answers to the ultramarine tints used in oils. But if the parts of the face where these tints appear are in shadow, the crayons composed of black and white must be substituted in their place.

Though all the face when first coloured should be laid in as brilliant as possible, yet each part should be kept in its proper tone; by which means the rotundity of the face will be preserved.

Let the student be careful when he begins the eyes to draw them with a crayon inclined to the carmine tint, of whatever colour the irises are of; he must lay them in brilliant, and at first not loaded with colour, but executed lightly: no notice is to be taken of the pupil yet. The student must let the light of the eye incline very much to the blue cast, cautiously avoiding a staring white appearance, (which, when once introduced, is seldom overcome), preserving a broad shadow thrown on its upper part, by the eyelash. A black and heavy tint is also to be avoided in the eye-brows; it is therefore best to execute them like a broad glowing shadow at first, on which, in the finishing, the hairs of the brow are to be painted; by which method of proceeding, the former tints will shew themselves through, and produce the most pleasing effect.

The student should begin the lips with pure carmine and lake, and in the shadow use some carmine and black; the strong vermilion tints should be laid on afterwards. He must beware of executing them with stiff, harsh lines, gently intermixing each with the neighbouring colours, making the shadow beneath broad, and enriched with brilliant crayons. He must form the corner of the mouth with carmine, brown, and greens, variously intermixed. If the hair is dark, he should preserve much of the lake and deep carmine tints therein; this may easily be overpowered by the warmer hair tints, which, as observed in painting the eye-brows, will produce a richer effect when the picture is finished; on the contrary, if this method is unknown or neglected, a poverty of colouring will be discernable.

After the student has covered over, or as artists term it, has dead-coloured the head, he is to sweeten the whole together, by rubbing it over with his finger, beginning at the strongest light upon the forehead, passing his finger very lightly, and uniting it with the next tint, which he must continue till the whole is sweetened together, often wiping his finger on a towel to prevent the colours being sullied. He must be cautious not to smooth or sweeten his picture too often, because it will give rise to a thin and scanty effect, and have more the appearance of a drawing than a solid painting; as nothing but a body of rich colours can constitute a rich effect. To avoid this, (as the student finds it necessary to sweeten with the fin-

ger), he must continually replenish the picture with more crayon.

When the head is brought to some degree of forwardness, let the back-ground be laid in, which must be treated in a different manner, covering it as thin as possible, and rubbing it into paper with a leather-stump. Near the face the paper should be almost free from colour, for this will do great service to the head, and by its thinness, give both a soft and solid appearance. In the back-ground also, no crayon that has shining in its composition should be used, but chiefly such as are the most brilliant, and the least adulterated. The ground being painted thin next the hair, will give the student an opportunity of painting the edges of the hair over in a light and free manner when he gives the finishing touches.

The student having proceeded thus far, the face, hair, and back-ground being entirely covered, he must carefully view the whole at some distance, remarking in what respect it is out of keeping, that is, what parts are too light, and what too dark, being particularly attentive to the white, or chalky appearances, which must be subdued with lake and carmine. The above method being properly put into execution, will produce the appearance of a painting principally composed of three colours, viz. carmine, black, and white, which is the best preparation a painter can make for the producing a fine crayon-picture.

The next step, is to complete the back-ground and the hair, as the dust, in painting these, will fall on the face, and would much injure it if that was completed first. From thence proceed to the forehead, finishing downward till the whole picture is completed.

In painting over the forehead the last time, begin the highest light with the most faint vermilion tints, in the same place where the faint carmine was first laid, keeping it broad in the same manner. In the next shade succeeding the lightest, the student must work in some light blue tints, composed of verditer and white, intermixing with them some of the deeper vermilion tints, sweetening them together with great caution*, insensibly melting them into one another, increasing the proportion of each colour as his judgment shall direct. Some brilliant yellows may also be used, but sparingly; and towards the roots of the hair, strong verditer tints, intermixed with greens, will be of singular service. Cooling crayons, composed of black and white, should succeed these, and melt into the hair. Beneath the eyes, the sweet, pearly tints are to be preserved, composed of verditer and white, and under the nose, and on the temples, the same may be used; beneath the lips, tints of this kind also are proper, mixing them with the light greens and some vermilion.

In finishing the cheeks, let the pure lake clear them from any dust contracted from the other crayons; then, with the lake may be intermixed the bright vermilion; and last of all, (if the subject should require it), a few touches of the orange-coloured crayon, but with extreme caution; after this, sweeten that part with the finger as little as possible, for fear of producing a heavy, disagreeable effect on the cheeks: as the beauty of a crayon-picture consists in

one.

* This direction is for the finest complexions, but the student must vary his colouring according to his subject.

one colour shewing itself through, or rather between another; this the student cannot too often remark, it being the only method of imitating beautiful complexions.

The eye is the most difficult feature to execute in crayons, as every part must be expressed with the utmost nicety, to appear finished; at the same time that the painter must preserve its breadth and solidity while he is particularizing the parts. To accomplish this, it will be a good general rule for the student to use his crayon in sweetening as much, and his finger as little as possible. When he wants a point to touch a small part with, he may break off a little of his crayon against the box, which will produce a corner fit to work with in the minutest parts. If the eye-lashes are dark, he must use some of the carmine and brown oker, and the crayon of carmine and black; and with these he may also touch their iris of the eye (if brown or hazel), making a broad shadow, caused by the eye-lash. Red tints of vermilion, carmine, and lake, will execute the corners of the eye properly; but if the eye-lids are too red, they will have a disagreeable, sore appearance. The pupil of the eye must be made of pure lamp-black; between this and the lower part of the iris, the light will catch very strong, but it must not be made too sudden, but be gently diffused round the pupil till it is lost in shade. When the eye-balls are sufficiently prepared, the shining speck must be made with a pure white crayon, which should be first broken to a point, and then laid on firm; but as it is possible they may be defective in neatness, they should be corrected with a pin, taking off the redundant parts, by which means they may be formed as neat as can be required.

The difficulty, with respect to the nose, is to preserve the lines properly determined, and at the same time so artfully blended into the cheek, as to express its projection, and yet no real line to be perceptible upon a close examination; in some circumstances it should be quite blended with the cheek, which appears behind it, and determined entirely with a slight touch of red chalk. The shadow caused by the nose is generally the darkest in the whole face, partaking of no reflection from its surrounding parts. Carmine and brown oker, carmine and black, and such brilliant crayons will compose it best.

The student having before prepared the lips with the strongest lake and carmine, &c. must, with these colours, make them completely correct; and, when finishing, introduce the strong vermillions, but with great caution, as they are extremely predominant. This, if properly touched, will give the lips an appearance equal, if not superior, to those executed in oils, notwithstanding the seeming superiority the latter has, by means of glazing*, of which the former is entirely destitute.

When the student paints the neck, he should avoid expressing the muscles too strong in the stem, nor should the bones appear too evident on the chest, as both have an unpleasant effect, denoting a violent agitation of the body, a circumstance seldom necessary to express in portrait-painting. The most necessary part to be expressed, and which should ever be observed,

(even in the most delicate subjects), is a strong marking just above the place where the collar bones unite; and if the head is much thrown over the shoulders, some notice should be taken of the large muscle that rises from behind the ear, and is inserted into the pit between the collar bones. All inferior muscles should be, in general, quite avoided. The student will find this caution necessary, as most subjects, especially thin persons, have the muscles of the neck much more evident than would be judicious to imitate. As few necks are too long, it may be necessary to give some addition to the stem, a fault on the other side being quite unpardonable, nothing being more ungraceful than a short neck. In colouring the neck, let the student preserve the stem of a pearly hue, and the light not so strong as on the chest. If any part of the breast appears, its transparency must also be expressed by pearly tints; but the upper part of the chest should be coloured with beautiful vermillions delicately blended with the other.

SECT. II. *Of the Drapery.*

DARK blue, purple, black, pink, and all kinds of red draperies also, should be first tinged with carmine, which will render the colours much more brilliant than any other method; over this should be laid on the paper, the middle tint, (a medium between the light and dark tints, of which the drapery is to be painted), except the dark masses of shadow, which should be laid on at first as deep as possible; these, sweetened with the finger, being destitute of the smaller folds, will exhibit a masterly breadth, which the lesser folds, when added, ought by no means to destroy. With the light and dark tints, the smaller parts are next to be made with freedom, executing, as much with the crayon, and as little with the finger as possible, in each fold touching the last stroke with the crayon, which stroke the finger must never touch. In the case of reflections, the simple touch of the crayon will be too harsh, therefore, fingering will be necessary afterwards, as reflected lights are always more gentle than those which are direct. With respect to reflections in general, they must always partake of the same colour as the object reflecting, but in the case of single figures, it may be useful to make some particular observations.

In a blue drapery, let the reflections be of a greenish cast; in green draperies, make them of a yellow tint; in yellow, of an orange; in orange, reflect a reddish cast; in all reds, something of their own nature, but inclined to the yellow: black should have a reddish reflection; the reflection of a reddish tint will also reflect purples to the best advantage.

Of whatever colour the drapery is, the reflection on the face must partake thereof, otherwise the picture, like paintings on glass, will have but a gaudy effect.

Linen, lace, fur, &c. should be touched spiritedly with the crayon, fingering very little, except the latter; and the last touches, even of this, like all other parts, should be executed by the crayon, without sweetening with the finger.

The methods above recommended, have been practiced by the most celebrated crayon-painters, whose

* The method with which painters in oils express transparency in the lips is, by painting them first with light vermilion tints, and, when dry, touching them over with pure lake.

works have been held in public estimation; but the knowledge of, and ability to execute each separate part with brilliancy and truth, will be found very insufficient to constitute a complete painter, without his judgment enables him to unite them with each other, by correctness of drawing, propriety of light and shadow, and harmony of colouring. In order to accomplish this, the student should carefully avoid finishing one part in particular, till he has properly considered the connection it is to have with the rest. The neglect of this is the principal reason why the performances of indifferent painters are so destitute of what is termed breadth, so conspicuously beautiful in the works of great masters. It must be granted, that this observation relates more particularly to large compositions, where a diversity of figures requires such a judicious disposition, that each may assist in the combination of a kind of universal harmony; yet, even in portrait-painting, the student should be particularly attentive to observe this idea of breadth, if he is desirous of acquiring that importance and dignity which constitutes excellence in painting.

SECT. III. *Of the Materials.*

THE perfection of the crayons consists, in a great measure, in their softness; for it is impossible to execute a brilliant picture with them if they are otherwise, on which account great care should be observed in the preparing them, to prevent their being hard. In all compositions, flake-white, and white-lead should be wholly rejected, because the slightest touch with either of these will unavoidably turn black.

The usual objection to crayon-paintings is, that they are subject to change; but whenever this happens, it is entirely owing to an injudicious use of the above-mentioned whites, which will stand only in oils. To obviate the bad effects arising from the use of such crayons, let the student make use of common whiting prepared in the following manner.

Take a large vessel of water, put the whiting into it, and mix them well together; let this stand about half a minute, then pour off the top into another vessel, and throw the gritty sediment away; let what is prepared rest about a minute, and then pour it off as before, which will purify the whiting and render it free from all dirt and grittiness. When this is done, let the whiting settle, and then pour the water from it; after which, lay it on the chalk to dry, and keep it for use, either for white crayons, or the purpose of preparing tints with other colours, for with this, all other tints may be safely prepared. If the student chuses to make crayons of the whiting immediately after it is washed, it is not necessary to dry it on the chalk, for it may be mixed instantly with any other colour, which will save considerable trouble. All colours of a heavy, or gritty nature, especially blue verditer, must be purified by washing after this method.

The student must be provided with a large, flexible pullet-knife, a large stone and muller to levigate the colours, two or three large pieces of chalk to absorb the moisture from the colours after they are levigated, a piece of flat glass to prevent the moisture from being absorbed too much, till the colours are rolled into

form, and vessels for water, spirits, &c. as necessity and convenience shall direct.

I. REDS.

It is rather difficult to procure either good carmine or good lake. Good carmine is inclined to the vermilion tint, and good lake to the carmine tint. The carmine crayons are prepared in the following manner.

1. **CARMINE.** As their texture is inclinable to hardness, instead of grinding and rolling them, take a sufficient quantity of carmine, lay it upon the grinding-stone, mix it with a levigating knife with spirits of wine, till it becomes smooth and even. The chalk-stone being ready, lay the colour upon it to absorb the spirit; but be careful that it is laid on in a proper shape for painting. If it is levigated too thin, the crayons will be too flat, and if too thick, it will occasion a waste of colour, by their adhering to the pallet-knife; but practise will render the proper degree of consistency familiar.

The simple colour being prepared, the next step is to compose the different tints by a mixture with whiting; the proportion to be observed consisting of 20 gradations to one, which may be clearly understood by the following directions. Take some of the simple colour, and levigate it with spirits of wine, adding about one part of washed whiting to three parts of carmine, of which, when properly incorporated, make two parcels. The next gradation should be composed of equal quantities of carmine and whiting, of which four crayons may be made. The third composition should have one fourth carmine, and three fourths whiting, of this make six crayons, which will be a good proportion with the rest. The last tint should be made of whiting, very faintly tinged with carmine; of which make about eight crayons, which will complete the above-mentioned proportion. As these compound tints are levigated, they are to be laid immediately upon the chalk that the moisture may be absorbed to the proper degree of dryness for forming into crayons, which may be known by its losing the greater part of its adhesive quality when taken into the hand: if the consistency is found to be right, it may be then laid upon the glass, which having no pores will prevent the moisture from becoming too dry before it is convenient to form it into crayons, otherwise the crayons would be full of cracks and very brittle, which will be a great inconvenience when they are used in painting.

2. **LAKE** is a colour very apt to be hard, to prevent which the student must observe the following particulars:

Take about half the quantity of lake intended for the crayons, and grind it very fine with spirits of wine; let it dry, and then pulverize it, which is easily done if the lake is good; then take the other half, and grind it with spirits, after which mix it with the pulverized lake, and lay it out directly in crayons on the chalk. This colour will not bear rolling. The simple colour being thus prepared, proceed with the compound crayons, as directed before, and in the same degrees of gradation as the carmine tints.

3. **VERMILION**; the best is inclined to the carmine tint.

teint. Nothing is required to prepare this colour more than to mix it on the stone with soft water or spirits, after which it may be rolled into crayons. The different tints are produced by a mixture of the simple colour with whiting, according to the proportions already given.

II. B L U E S .

1. **PRUSSIAN-BLUE** is a colour very apt to bind, and is rendered soft with more difficulty than carmine and lake. The same method of preparation is to be followed with this as directed with respect to lake, only it is necessary to grind a larger quantity of the pure colour, as it is chiefly used for painting draperies. The different tints may be made according to necessity, or the fancy of the painter.

2. **BLUE-VERDITER** is a colour naturally gritty, and therefore it is necessary to wash it well. Its particles are so coarse as to require some binding matter to unite them, otherwise the crayons will never adhere together. To accomplish this, take a quantity sufficient to form two or three crayons, to which add a piece of flaked plaster of Paris about the size of a pea; mix these well together, and form the crayons upon the chalk. This blue is extremely brilliant, and will be of great use in heightening draperies, &c. The tints must be formed with whiting as directed in the former instances, and are highly serviceable for painting flesh, to produce those pearly tints so beautiful in crayon-pictures. It is not necessary to mix the compounds with spirits, as clear water will be sufficient.

III. G R E E N S .

BRILLIANT-GREENS are produced with great difficulty. In Switzerland, they have a method of making them, far superior to ours*. We usually take yellow oker, and after grinding it with spirits, mix it with the powder of Prussian blue, then temper it with a knife, and lay the crayons on the chalk, without rolling them. Instead of this, some use king's yellow mixed with Prussian blue, and others, brown oker and Prussian blue. The crayons made of the two last may be rolled. Various tints may be produced by these colours, according to fancy or necessity; some to partake more of the blue, and others of the yellow.

IV. Y E L L O W S .

1. **KING'S-YELLOW** is the most useful and the most brilliant, levigated with spirits of wine, and compose the different tints as before directed. Yellow oker and Naples yellow ground with spirits will make useful crayons.

2. **ORANGE** is produced with king's-yellow and vermilion ground together with spirits, and the tints formed as in other cases, but no great quantity of them is required.

V. B R O W N S .

1. **CULLENS-EARTH** is a fine dark brown. After six or eight of the simple crayons are prepared, several rich compound tints may be produced from it, by a mixture with carmine, in various degrees. Black,

carmine, and this colour, mixed together, make useful tints for painting hair; several gradations may be produced from each of these by a mixture with whiting. Roman, or brown oker is an excellent colour, either simple or compounded with carmine. Whiting tinged in several degrees with either of these, will prove very serviceable in painting.

2. **UMBER** may be treated in just the same manner, only it is necessary to levigate it with spirits of wine.

VI. P U R P L E S .

PRUSSIAN-BLUE ground with spirits, and mixed with pulverized lake, will produce a good purple. Carmine thus mixed with Prussian blue, will produce a purple something different from the former. Various tints may be made from either of these compounds by a mixture with whiting.

VII. B L A C K .

1. **LAMP-BLACK** is the only black that can be used with safety, as all others are subject to mildew; but as good lamp-black is very scarce, the student will, perhaps, find it most expedient to make it himself; the process of which is as follows:

Provide a tine cone, fix it over a lamp at such a height that the flame may just reach the cone for the foot to gather within it. When a sufficient quantity is collected, take it out, and burn all the grease from it in a crucible. It must then be ground with spirits and laid on the chalk to absorb the moisture. Various grey tints may be formed from this by a mixture with whiting, as mentioned in former instances.

2. **VERMILION** mixed with carmine.—This is a composition of great use, and tints made from this with whiting will be found to be very serviceable.

3. **CARMINE** and black is another good compound, of which five or six gradations should be made, some partaking more of the black, and others having the carmine most predominant, besides several tints by a mixture with whiting.

4. **VERMILION** and black is also a very useful compound, from which several different tints should be made.

5. **PRUSSIAN-BLUE** and black is another good compound, and will be found of singular service in painting draperies.

It is impossible to lay down rules for the forming every tint necessary in composing a set of crayons, there being many accidental compositions, entirely dependant on fancy and opinion. The student should make it a rule to save the leavings of his colours; for of these he may form various tints, which will occasionally be useful.

SECT. IV. *Of Rolling the Crayons, and disposing them for Painting.*

THE different compositions of colours must be cut into a proper magnitude, after they are prepared, in order to be rolled into pastils, for the convenience of using them. Each crayon should be formed in the left hand with the ball of the right, first formed cylindrically,

* Mr Bonhote, in Haylé's court, Soho, is the original importer of these crayons from Lausanne, in Switzerland; the student may find it very useful to supply deficiencies of this nature with them, as the ingredients which compose these brilliant crayons are not to be met with in England.

cally, and then tapered at each end. If the composition is too dry, dip the finger in water; if too wet, the composition must be laid upon the chalk again to absorb more of the moisture. The crayons should be rolled as quick as possible; and when finished, must be laid upon the chalk again, to absorb all remaining moisture. After the gradation of tints from one colour are formed, the stone should be well scraped and cleaned with water before it is used for another colour.

When the set of crayons is completed according to the rules prescribed, they should be arranged in classes for the convenience of painting with them. Some thin drawers, divided into a number of partitions is the most convenient method of disposing them properly. The crayons should be deposited according to the several gradations of light. The bottom of the partitions must be covered with bran, as a bed for the colours; because it not only preserves them clean, but prevents their breaking.

C R E

C R E

CREAM, a general name applicable to all substances that separate from a liquor, and are collected upon its surface; but is more particularly applied to the following.

CREAM of *Lime*, is that part of the lime which has been dissolved in the water in its caustic state, but having again attracted some fixed air from the atmosphere, becomes incapable of solution, and therefore separates from the water in the mild state of chalk, or limestone.

CREAM of *Milk*, generally called simply *cream*, is the most oily part of the milk; which being naturally only mixed, and not dissolved in the rest, soon separates from them, as being specifically lighter; after which it collects on the surface; from which it is generally skimmed, to complete the disengagement of the oily from the aqueous and ferous parts, that is to make butter *. Cream of milk is not only an agreeable aliment when recent, but is also useful in medicine as a lenient, when applied to tetter and erysipelas attended with pain and proceeding from an acrid humour.

CREAM of *Tartar*. See CHEMISTRY, n° 292.

CREAT, in the menage, an usher to a riding master; or a gentleman bred in the academy, with intent to make himself capable of teaching the art of riding the great horse.

CREATION, is commonly applied to the original formation of the materials whereof the visible system of nature is formed. It is reckoned to be an absolute and incommunicable prerogative of divine power, as by creation all things were produced out of nothing; the subsequent creations being only transformations or changes of shape in what was already made.

There is no subject concerning which there have been more disputes than this of creation. It is certain that none of the ancient philosophers had the smallest idea of its being possible to produce a substance out of nothing, or that even the power of the deity himself could work without any materials to work upon. Hence some of them, among whom was Aristotle, asserted that the world was eternal, both as to its matter and form. Others, though they believed that the

The box made use of when the student paints, should be about a foot square, with nine partitions. In the upper corner, on the left hand, (supposing the box to be in the lap when he paints), let him place the black and grey crayons, those being the most seldom used; in the second partition, the blues; in the third, the greens and browns; in the first partition on the left hand of the second row, the carmines, lakes, vermilion, and all deep reds; the yellows and orange in the middle, and the pearly tints next; and as these last are of a very delicate nature, they must be kept very clean, that the gradations of colour may be easily distinguished: In the lowest row, let the first partition contain a piece of fine linen rag to wipe the crayons with while they are using; the second, all the pure lake and vermilion tints; and the other partition may contain those tints, which, from their complex nature, cannot be classed with any of the former.

gods had given the world its form, yet imagined the materials whereof it is composed to have been eternal. Indeed, the opinions of the ancients, who had not the benefit of revelation, were on this head so confused and contradictory, that nothing of any consequence can be deduced from them. The free-thinkers of our own and of former ages have denied the possibility of creation, as being a contradiction to reason, and of consequence have taken the opportunity from thence to discredit revelation. On the other hand, many defenders of the sacred writings have asserted, that creation out of nothing is so far from being a contradiction to reason, that it is not only probable but demonstrably certain. Nay, some have gone so far as to say, that from the very inspection of the visible system of nature, we are infallibly certain that it was once in a state of non-existence. It would be impossible for us, however, to enter into the multiplicity of arguments used on both sides; nor can we pretend to settle it, as the subject is confessedly above human comprehension. We shall therefore content ourselves with giving a short abstract of the opinions of those that seem to keep the most proper medium between the extremes above mentioned.

“ It is confessed (say they) that creation is utterly beyond the comprehension of man. We readily allow that the power which gives existence to that which had none before is imperceptible to human wisdom; but though it is so to us, that is no reason why it should be so to the Deity. It is impossible that a negative argument of this kind can be taken for a demonstration, unless we lay it down as a first principle, that man is the wisest of all possible beings. Though it is granted, therefore, that our reason cannot discover the world to be created, this only proves that we cannot create, but it cannot in the least affect the truth of the sacred writings. Nay, so far from this being any objection to the truth of the doctrine, it is a proof nothing short of demonstration in its favour. When it is agreed on all hands that creation out of nothing is an effect of power whereof man can form no idea either by his senses or reason, it thence follows, that it is absolute-

Credentials ly beyond the power of his imagination also to invent or relate any thing concerning it. The reason of this is, that the imagination of man, as well as his reason, is limited by his senses; and therefore, we can neither reason nor imagine but where sense lays a foundation. But as creation is utterly beyond our senses, it is therefore beyond our imagination also, and consequently cannot be a lie of human invention. Hence we see, that in fact it never was discovered by the most learned and sharp-sighted philosophers. The thought is peculiar to that book which we commonly reckon to be of divine original; nor is it to be found in human writings of any age or country, excepting where it is manifestly taken from the scriptures."

CREDENTIALS, letters of recommendation and power, especially such as are given to ambassadors or public ministers, by the prince or state that sends them to foreign courts.

CREDIBILITY, a species of evidence, less indeed than absolute certainty or demonstration, but greater than mere possibility: it is nearly allied to probability, and seems to be a mean between possibility and demonstration.

CREDIT, in commerce, a mutual trust or loan of merchandize or money, on the reputation of the property and sufficiency of a dealer. See **COMMERCE**.

CREDITON, a market-town in Devonshire, considerable for a good woollen manufactory: it is situated about 9 miles north-west of Exeter, in W. Long. 3. 50. and N. Lat. 50. 50.

CREDITOR, a person to whom any sum of money is due, either by obligation, promise, or otherwise. See **DEBT**.

CREECH (Thomas), an eminent poet in the 17th century, of Dorsetshire, born 1650. He soon began to distinguish himself in the republic of letters by the works which he published; but they were of no advantage to his fortune, since his circumstances were always very indifferent. He died in a very unfortunate manner. In 1700 he fell in love with a woman who treated him with great neglect, though she was complaisant enough to others. He could not digest this affront; but shut himself up in his study, where he hanged himself. Others say, that being naturally morose, his resentments frequently engaged him in disputes which in the end proved fatal to him. Mr Dryden styles him a learned and judicious writer. His translation of *Lucretius* is esteemed. But he wrote beside this a translation of *Horace*, and many other pieces.

CREED, a brief summary of the articles of a Christian's belief.

The most ancient form of creeds is that which goes under the name of the apostolic creed; besides this, there are several other ancient forms and scattered remains of creeds to be met with in the primitive records of the church. The first is the form of apostolical doctrine, collected by Origen; the second is a fragment of a creed preserved by Tertullian; the third remains of a creed is in the works of Cyprian; the fourth, a creed composed by Gregory Thaumaturgus, for the use of his own church; the fifth, the creed of Lucian the martyr; the sixth, the creed of the apostolical constitutions. Besides these scattered remains

of the ancient creeds, there are extant some perfect forms, as those of Jerusalem, Cæsaræa, Antioch, &c.

The most universal creeds are, the **APOSTOLICAL**, the **ATHANASIAN**, and the **NICENE** creeds.

CREEK, the part of a haven where any thing is landed from the sea.

CREEPER, in ornithology. See **CERTHIA**.

CREEPER, in naval affairs, an instrument of iron resembling a grappling, having a *shank*, and four hooks or claws. It is used to throw into the bottom of any river or harbour, with a rope fastened to it to hook and draw up any thing from the bottom which may have been lost. See Plate LXXXI. fig. 11.

CRELIUS (John), a famous Socinian, born in 1590, in a village near Nuremberg. In 1612 he went into Poland, where the Unitarians had a school, in which he became professor of divinity, and minister at Crackow, where he died in 1632, aged 42. He was the author, 1. Of a famous Treatise against the Mystery of the Trinity; 2. Commentaries on a part of the New Testament; and other works. All of them are scarce.

CREMA, a city and bishop's see of Italy, capital of a district of the Milanese, called from it *Crema*; it stands almost in the middle between Milan and Mantua, in E. Long. 10. 15. and N. Lat. 45. 20.

CREMASTER, in anatomy, the name of a muscle of the testicle, of which there is one on each side. See **ANATOMY**, *Table of the Muscles*.

CREMONA, a city of Italy, and capital of a district of the Milanese, called from it the *Cremonese*; is situated 45 miles south-east of Milan, in E. Long. 10. 30. and N. Lat. 45. 0.

CRENATED, in botany. See there, p. 1296, n° 74.

CRENELLE, or **IMBATTLED**, in heraldry, is used when any honourable ordinary is drawn, like the battlements on a wall to defend men from the enemies' shot. This attribute belongs to the arms of such as have defended castles for their prince or country, or of such as are skilled in architecture.

CRENOPHYLAX, in antiquity, a magistrate of Athens, who had the inspection of fountains.

CREON, the first annual archon of Athens. See **ATTICA**, n° 28.

CREPANCE, in the menage, a chop or cratch in a horse's leg, given by the sponges of the shoes of one of the hinder feet crossing and striking against the other hinder foot. This cratch degenerates into an ulcer.

CREPIS, **HAWK-WEED**; a genus of the polygamia æqualis order, belonging to the lyngenea class of plants. There are 14 species, most of them herbaceous annuals, rising to the height of a foot, or a foot and an half; and having their branches terminated by ligulated compound red and yellow flowers. These are very large, and consist of many flat florets spread over one another imbricatum, and when fully blown appear as if radiated. They are very conspicuous and beautiful; and appear in June, July, and August. They are succeeded by plenty of seed, which, if permitted to scatter on the ground, will produce a number of young plants without further trouble.

CREPUNDIA, in antiquity, a term used to express such

Creek
|
Crependia.

◀ Crescent
|
◀ Crescent.

such things as were exposed along with children, as rings, jewels, &c. serving as tokens whereby they afterwards might be known.

CRESCENT, the new moon, which, as it begins to recede from the sun, shews a little rim of light, terminating in points, called *horns*, that are still increasing, till it is in opposition to the sun, at which time it is full moon, or quite round.

CRESCENT, in heraldry, a bearing in form of a new moon.

It is used either as an honourable bearing; or as the difference to distinguish between elder and younger families, this being generally assigned to the second son and those that descend from him. The figure of the crescent is the Turkish symbol, with its points looking towards the top of the chief, which is its most ordinary representation, called *crescent montant*. Crescents are said to be adossed, when their backs are turned towards each other; a crescent is said to be inverted, when its points look towards the bottom; turned crescents have their points looking to the dexter side of the shield; cornuted crescents, to the sinister side; and affronted crescents, contrary to the adossed, have their points turned to each other.

CRESCENT, a term among farriers. Thus a horse is said to have crescents when that part of the coffinbone, which is most advanced, falls down and presses the sole outwards, and the middle of the hoof above shrinks, and becomes flat, by reason of the hollowness beneath it.

CRESCENTIA, the **CALABASH-TREE**; a genus of the angiospermia order, belonging to the didynamia class of plants. There are two species.

1. The *Cujete*, with oblong narrow leaves and a large oval fruit, is a native of Jamaica and the Leeward Islands. It hath a thick trunk covered with a whitish bark, which rises from 20 to 30 feet high, and at the top divides into many branches, forming a large and regular head, garnished with leaves, which come out irregularly, sometimes single; at other times many arise out of the same knot: the flowers are produced from the sides of the large branches, and sometimes from the trunk, standing upon long foot-stalks. They have but one petal, which is irregular; and they are of a greenish yellow colour, striped and spotted with brown. These are succeeded by very large fruit, generally spherical, sometimes oval; and at other times they have a contracted neck like a bottle; and are so large, that when the pulp and seeds are cleaned out, the shells will contain three pints or two quarts of liquid. The fruit is covered externally with a thin skin of a greenish-yellow colour when ripe. When this is peeled off, there appears a hard ligneous shell, inclosing a pale yellowish soft pulp of a tart unsavoury flavour, surrounding a great number of flat heart-shaped seeds.

2. The *latifolia*, or broad-leaved calabash, seldom rises more than 15 or 20 feet high, with an upright trunk, covered with a white smooth bark, sending out many lateral branches at the top, garnished with leaves three inches in length, and one and a quarter broad, ranged alternately. The flowers come out as in the former species; but are smaller, and of a deeper yellow colour. The fruit of this sort is sometimes round, sometimes oval, but of very unequal

sizes. Both these species are easily propagated by seeds; but the plants are too tender to live in this country, unless they are constantly kept in a stove.

The shells of calabashes are made use of for various purposes. At Barbadoes, besides drinking-cups and punch-bowls, there are made of them spoons, dishes, and other utensils for the slaves. Some of these shells are so large, as to be capable of holding 15 pints of water. The pulp is seldom eaten, except by cattle in the time of drought. The wood, which is hard and smooth, is made into stools, chairs, and other furniture.

CRESS, **WATER-CRESS**, or **CRESSES**, in botany. See **SISYMBRIUM**.

Indian Cress. See **TROPEOLUM**.

CRESSY, a port-town of Picardy in France, about 44 miles south of Calais, and 27 north-west of Abbeville, remarkable on account of the victory obtained there over the French, by Edward III. of England, in the year 1346. E. Long. 2.0. N. Lat. 50. 20.

CREST, in armoury, the top-part of the armour, for the head, mounting over the helmet, in manner of a comb, or tuft of a cock; deriving its name from *crissa*, a cock's comb.

The crest was for the most part made of feathers, or the hair of horses tails or mains. The soldiers took great pride in adorning them.

CREST, in heraldry, the figure placed above the helmet in an achievement. See **HERALDRY**, n° 49.

CREST-fallen, a fault of an horse, when the upper part of his neck, called the *crest*, hangs to one side: this they cure by placing it upright, clipping away the spare skin, and applying plasters to keep it in a proper position.

CRETA, or **CHALK**, in natural-history. See **CHALK**.

CRETE, one of the largest islands in the Mediterranean, lying between 22 and 27 degrees of east longitude, and between 35 and 36 degrees of north latitude. According to Strabo, this island is 287 miles in length; according to Pliny, 270; and, according to Scylax, 312. As to its breadth, it is not, as Pliny observes, above 55 miles where widest; whence it was styled, as Stephanus observes, the *Long Island*. It has the Archipelago to the north, the African sea to the south, the Carpathian sea to the east, and the Ionian to the west. Anciently it was known by the names of *Aria*, *Chthonia*, *Idea*, *Curete*, *Macaria*, &c.; but its most common name was that of *Crete*. This last name is by some derived from the *Curetes*, whom they reckon to have been the first inhabitants of the island; by others from the nymph *Crete*, daughter of Hesperus, or from Cretus the son of Jupiter, who reigned here.

The first inhabitants of Crete, according to Diodorus Siculus, were the *Idæi Daetyli*, who inhabited mount Ida. See **DACTYLI**.

Next to the *Idæi Daetyli* were the nine *Curetes*; some of whom are supposed to have sprung from the earth, and others to be descended from the *Idæi Daetyli*. See **CURETES**.

The *Titans* were cotemporary with the *Curetes*; and dwelt in the country where the city of *Gnosus* was afterwards built. They were in number six men, and five women. Some say they were the offspring

◀ Crest
|
◀ Crest.

of Uranus and Terra; others that they were descended from one of the Curetes and *Titea*; whence their name of *Titans*. The men were *Cronus*, or *Saturn*, *Hyperion*, *Cæus*, *Japetus*, *Crius*, and *Occanus*; the women were *Rhæa*, *Themis*, *Mnemosyne*, *Phœbe*, and *Thetis*. All these were also deified, on account of their useful inventions. Saturn, the eldest, obtained the kingdom of Crete, and brought his subjects to a somewhat more civilized kind of life than they formerly used, which gave occasion to the many fables of the poets concerning the Golden Age. Hyperion was the first who observed the motions of the sun, moon, and stars, measuring by them the seasons of the year; and hence he was called the father of the planets. Latona was the daughter of Cæus and Phœbe, and Prometheus, so famous among the poets, the son of Japetus. He is said to have found out the way of striking fire with flint, which gave occasion to the fable of his stealing fire from heaven. Mnemosyne invented many things conducing to help a man's memory, whence her name. Themis taught the art of divination; instructed men in holy rites; and prescribed laws for the worship of the gods, and for the preservation of peace and good government among men. Vesta, Ceres, Juno, Jupiter, Neptune and Pluto, are supposed to have been the children of Saturn and Rhæa. Vesta invented the art of building houses; Ceres the use of corn; Neptune the art of navigation; and Pluto, funeral solemnities. Hence the latter was styled "Prince of the infernal shades;" and the former, "Prince of the sea."

Though the island of Crete is one of the most remarkable in the writings of the ancient historians and poets, its history affords nothing interesting. The only remarkable particulars are the wise institutions of one of the kings, called *Minos*; who for his wisdom and prudence was said to have been made one of the judges of the dead. At what time he lived is uncertain; but no sooner did he ascend the throne than he made the happiness of his people his first object. A wife system of laws he justly thought was what alone could tend to this; and to give these laws the greater weight with his subjects, he fell upon an expedient practised by many other legislators, namely, to pretend that he received them from Jupiter.

This prince occasioned a change in the government, from a monarchy to a republic. According to the spirit of his institutions, the government of Crete was a democracy tempered with an aristocracy. The supreme authority devolved to ten chosen magistrates, who composed their senate. Ten others were afterwards associated with them, who were distinguished by the title of *cosmi*. The former, called *senators*, were established as guardians of the laws and government. They did not rise to that dignity till after they had exercised, for a certain time, the office of *cosmi*; and the latter were appointed to maintain a just medium between the power of the great, and the weakness of the people of whom they were appointed protectors. But the power both of the senators and *cosmi* was limited in such a manner, that they could not enrich themselves during their administration. A magistrate whose duty it was to see that they were put in execution, was obliged to visit thrice every year

the towns depending on the government; and he carried with him tablets, or plates of brass, on which they were engraved. The Cretan laws seem to have been modelled for people who had no other business than to attack enemies or to defend themselves. They were particularly careful of the education of their youth. Masters were appointed, who taught them to repeat, and sing regularly, hymns in honour of the gods and of their laws, and of heroes. They even gave them some tincture of polite learning. The poems of Homer were not unknown in Crete, though they did not hold foreign poets in much estimation.

The Cretans, from their infancy, were accustomed to bear hunger and thirst with patience. As they advanced in years, they were taught the exercises of running, hunting, archery (in which they particularly excelled), the use of the sword, and wrestling. For their martial improvement also the *Pyrrhic dance* was instituted, in which the young men completely imitated the motions and actions of combatants. Thus they were early accustomed to see arms, and their use, without emotion. Indeed no people had greater occasion for learning the art of war than the Cretans, as they were for many ages in perpetual enmity with one another, the inhabitants of each city claiming the sovereignty of the whole island. Hence also they became very useful auxiliaries to other nations. Many of Alexander's victories were owing to the Cretan auxiliaries; and to the archers and slingers brought from this island the Romans were highly indebted, after they became acquainted with it.

One of Minos's institutions which Aristotle much admires was, that all his subjects should use the same diet, and take their repasts together, without any distinction between poor and rich. By this means a kind of equality was introduced among them, they were accustomed to a frugal and sober way of life, and friendships were cemented among them. The public defrayed the charges of these meals; one part of the revenues of the state being applied to the uses of religion, and the salaries of the magistrates; and the rest allotted for the public meals. After their repast, the old men discoursed of the actions and virtues of their ancestors, and of such as had distinguished themselves either by their valour in war, or their wisdom in peace; and the youth, who were present at these entertainments, were exhorted to propose to themselves those great men as examples whom they were to imitate. Another institution greatly admired by Plato was, to inspire the youth with an high regard for the customs, maxims, and laws, of their own country: not suffering them to dispute, or call in question the wisdom of their constitution; but commanded them to look upon the laws as dictated by the gods themselves. He enjoined every one to honour in a particular manner the magistrates and aged persons; and that nothing might lessen the respect due to their age, if any defect was found in them, it was never to be mentioned in the presence of their youth. A custom established by Minos, and afterwards adopted by the Romans, gives us reason to believe, that even the slaves in this island were better treated than any where else; for, at the feasts of Mercury, the masters waited on their slaves at table, and performed about

Crew
Cribration.

about them the same offices which they received from their slaves the rest of the year. The laws of Minos were ancient in so great repute, that Lycurgus passed a considerable time in Crete, employing himself in the study of their constitution, and forming his laws on the model of those which at that time obtained in the island. Plato tells us, that, under the government of his wife a prince, Crete became the abode of virtue, probity, and justice; and that the laws which he established were so well founded in justice and equity, that they subsisted in their full vigour even in his time; that is, above 900 years after they had been first published. It is true the Cretans degenerated by degrees from their ancient probity; and at length, by an entire change of manners, became the most vicious nation known either to the Greeks or Latins. Polybius writes, that the Cretans in his time were interested and avaricious to such a degree as to think no lucre forbidd. Suidas and Callimachus give them the character of liars and impostors. St Paul quotes against them the testimony of one of their own poets, who paints them in very disagreeable colours. The impurity of their amours is too well known from the accounts given us by Strabo, Servius, and Athenæus. These authors inform us, that the unnatural passion of the Cretans for boys proceeded to a degree of madness, and that from them it overspread all Crete. But this change of manners, in whatever time it happened, does not affect the probity of the ancient Cretans, nor lessen the glory of their legislature.

Crete was the most ancient maritime power mentioned by the Greek historians. It is about 600 miles in circumference, though not 1-20th part so large as Great Britain; and this large extent of coast was of great service in this respect*. It was exceedingly fruitful, producing all sorts of grain, fruits, &c. The Cretan wines, particularly, are greatly commended both by ancient and modern writers. From the fruitfulness of its soil, and the purity of its air, it had the appellation of the *fortunate island*; and from its maritime power was styled *empress of the sea*. In ancient times also it had the name of *Hecatonpolis*, as containing 100 cities; 90 of these were built before the Trojan war, and 10 after it. About 66 years before Christ this island fell under the power of the Romans. In the year of Christ 812 it was taken from them by the Saracens, who built the present capital of the island called *Chandax*, or *Gandia*; from whence the whole island has got its modern name of *CANDIA*. It is now subject to the Turks.

CREW, the company of sailors belonging to a ship, boat, or other vessel.

CREX, in ornithology, a species of RALLUS.

CRIB, the rack or manger of a stable, or the stall or cabin of an ox. It is also used for any small habitation, as a cottage, &c.

CRIB, in the English salt-works, a name given to a sort of case used in some places instead of the *drab*, to put the salt into as it is taken out of the boiling pan.

CRIBBAGE, a game at cards, to be learnt only by practice.

CRIBRATION, in pharmacy, the passing any sub-

stance through a sieve, or search, in order to separate the finer particles from the grosser.

CRIBROSUM os, in anatomy, called also *os ethmoides*. See ANATOMY, n° 16.

CRICELASIA, the driving a ring or hoop. Driving a hoop was one of the ancient gymnastics: this hoop was as high as the breast of the person who used it. It was commended for rendering the limbs pliable, and for strengthening the nerves.

CRICHTON (James), known by the appellation of "the admirable Crichton," was born in Perthshire, at Clunie his paternal inheritance, in the year 1557. He studied grammar at the school of Perth, and philosophy at the college of St Andrews.

At the age of 20 years, he thought of improving himself by foreign travel; and having arrived at Paris, the desire of procuring the notice of its university, or the pride of making known his attainments, induced him to affix placards on the gates of its colleges, challenging the professors to dispute with him in all the branches of literature and the sciences, in 10 languages, and either in prose or in verse. On the day appointed 3000 auditors assembled. Fifty masters, who had laboriously prepared for the contest, proposed to him the most intricate questions; and he replied to them in the language they required, with the happiest propriety of expression, with an acuteness that seemed superior to every difficulty, and with an erudition which appeared to have no bounds. Four celebrated doctors of the church then ventured to enter into disputation with him. He obviated every objection they could urge in opposition to him; he refuted every argument they advanced. A sentiment of terror mingled itself with their admiration of him. They conceived him to be Antichrist*.

This singular exhibition continued from nine o'clock in the morning till six at night, and was closed by the president of the university, who having expressed, in the strongest terms of compliment, the sense he entertained of his capacity and knowledge, advanced towards him, accompanied by four professors, and bestowed on him a diamond ring and a purse of gold.

The acclamations of the spectators were frequent and loud; and, what completed the amazement of the university, during the interval which passed from his giving the challenge till the day appointed for accepting it, he applied not to his books. He rather seemed indolently to avoid them. He engaged in parties at cards, and at dice; he exercised himself at tennis, and other youthful sports. This conduct was interpreted to be in derision of that learned society; but whether justly, or individually, we know not; and the students, to support or avenge the cause of their humiliated teachers, fixed a lampoon on the gate of the Sorbonne, intimating, that those who would see this monster of erudition, must look for him at the tavern or the brothel.

Nor, it is said, was this formidable trial attended with any waste of his fire, or usual vivacity. It seemed not an exertion that could fatigue him. The day after, he attended a public match of tilting; and, in the presence of the princes of France, and a great many

quis de Bec-
caria, &c.

order to check the progress of some very prevalent offence; from some, or from all, of these causes it hath happened, that the criminal law is in every country of Europe more rude and imperfect than the civil. We shall not here enter into any minute enquiries concerning the local constitutions of other nations; the inhumanity and mistaken policy of which have been sufficiently pointed out by ingenious writers of their country. But even with us in Britain, where our crown-law is with justice supposed to be more nearly advanced to perfection; where crimes are more accurately defined, and penalties less uncertain and arbitrary; where all our accusations are public, and our trials in the face of the world; where torture is unknown, and every delinquent is judged by such of his equals, against whom he can form no exception, nor even a personal dislike;—even here we shall occasionally find room to remark some particulars that seem to want revision and amendment. These have chiefly arisen from too scrupulous an adherence to some rules of the ancient common law, when the reasons have ceased upon which those rules were founded; from not repealing such of the old penal laws as are either obsolete or absurd; and from too little care and attention in framing and passing new ones. The enacting of penalties to which a whole nation shall be subject, ought not to be left, as a matter of indifference, to the passions or interests of a few, who upon temporary motives may prefer or support such a bill; but be calmly and maturely considered by persons who know what provisions the laws have already made to remedy the mischief complained of, who can from experience foresee the probable consequences of those which are now proposed, and who will judge without passion or prejudice how adequate they are to the evil. It is never usual in the house of peers even to read a private bill which may affect the property of an individual, without first referring it to some of the learned judges, and hearing their report thereon. And surely equal precaution is necessary, when laws are to be established, which may affect the property, the liberty, and perhaps even the lives, of thousands. Had such a reference taken place, it is impossible that in the 18th century it could ever have been made a capital crime, to break down (however maliciously) the mound of a fishpond, whereby any fish shall escape; or to cut down a cherry-tree in an orchard. Were even a committee appointed but once in an hundred years to revise the criminal law, it could not have continued to this hour a felony without benefit of clergy, to be seen for one month in the company of persons who call themselves or are called *Egyptians*.

It is true, that these outrageous penalties, being seldom or never inflicted, are hardly known to be the law by the public; but that rather aggravates the mischief, by laying a snare for the unwary. Yet they cannot but occur to the observation of any one, who hath undertaken the task of examining the great outlines of our law, and tracing them up to their principles; and it is the duty of such a one to hint them with decency to those, whose abilities and stations enable them to apply the remedy. Proceed we now to consider (in the first place), the general nature of crimes.

Blackf.
Comment.

I. A crime, or misdemeanour, is an act committed, or omitted, in violation of a public law, either forbidding or commanding it. This general definition comprehends both crimes and misdemeanours; which, properly speaking, are mere synonymous terms: though, in common usage, the word “crimes” is made to denote such offences as are of a deeper and more atrocious dye; while smaller faults, and omissions of less consequence, are comprised under the gentler name of “misdemeanours” only.

The distinction of public wrongs from private, of crimes and misdemeanours from civil injuries, seems principally to consist in this: that private wrongs, or civil injuries, are an infringement or privation of the civil rights which belong to individuals, considered merely as individuals; public wrongs, or crimes and misdemeanours, are a breach and violation of the public rights and duties, due to the whole community, considered as a community, in its social aggregate capacity. As if I detain a field from another man, to which the law has given him a right, this is a civil injury, and not a crime; for here only the right of an individual is concerned, and it is immaterial to the public, which of us is in possession of the land: but treason, murder, and robbery are properly ranked among crimes; since, besides the injury done to individuals, they strike at the very being of society; which cannot possibly subsist, where actions of this sort are suffered to escape with impunity.

In all cases the crime includes an injury: every public offence is also a private wrong, and somewhat more; it affects the individual, and it likewise affects the community. Thus treason in imagining the king's death, involves in it conspiracy against an individual, which is also a civil injury: but as this species of treason in its consequences principally tends to the dissolution of government, and the destruction thereby of the order and peace of society, this denominates it a crime of the highest magnitude. Murder is an injury to the life of an individual; but the law of society considers principally the loss which the state sustains by being deprived of a member, and the pernicious example thereby set, for others to do the like. Robbery may be considered in the same view: it is an injury to private property; but, were that all, a civil satisfaction in damages might atone for it: the public mischief is the thing, for the prevention of which our laws have made it a capital offence. In these gross and atrocious injuries the private wrong is swallowed up in the public: we seldom hear any mention made of satisfaction to the individual; the satisfaction to the community being of very great. And indeed, as the public crime is not otherwise avenged than by forfeiture of life and property, it is impossible afterwards to make any reparation for the private wrong: which can only be had from the body or goods of the aggressor. But there are crimes of an inferior nature, in which the public punishment is not so severe, but it affords room for a private compensation also; and herein the distinction of crimes from civil injuries is very apparent. For instance, in the case of battery, or beating another, the aggressor may be indicted for this at the suit of the king, for disturbing the public peace, and be punished criminally by fine and imprisonment.

Crime and
PunishmentCrime and
Punishment

fonment: and the party beaten may also have his private remedy by action of trespass for the injury, which he in particular sustains, and recover a civil satisfaction in damages. So also, in case of a public nuisance, as digging a ditch across a highway, this is punishable by indictment, as a common offence to the whole kingdom, and all his majesty's subjects: but if any individual sustains any special damage thereby, as laming his horse, breaking his carriage, or the like, the offender may be compelled to make ample satisfaction, as well for the private injury, as for the public wrong.

II. The nature of crimes and misdemeanours in general being thus ascertained and distinguished, we proceed in the next place to consider the general nature of punishments: Which are evils or inconveniences consequent upon crimes and misdemeanours; being devised, denounced, and inflicted by human laws, in consequence of disobedience or misbehaviour in those, to regulate whose conduct such laws were respectively made. And herein we will briefly consider the *power*, the *end*, and the *measure*, of human punishment.

I. As to the *power* of human punishment, or the right of the temporal legislator to inflict discretionary penalties for crimes and misdemeanours. It is clear, that the right of punishing crimes against the law of nature, as murder and the like, is in a state of mere nature vested in every individual. For it must be vested in somebody; otherwise the laws of nature would be vain and fruitless, if none were empowered to put them in execution: and if that power is vested in any one, it must also be vested in all mankind; since all are by nature equal. Whereof the first murderer Cain was so sensible, that we find him expressing his apprehensions, that whoever should find him would slay him. In a state of society this right is transferred from individuals to the sovereign power; whereby men are prevented from being judges in their own causes, which is one of the evils that civil government was intended to remedy. Whatever power therefore individuals had of punishing offences against the law of nature, that is now vested in the magistrate alone; who bears the sword of justice by the consent of the whole community. And to this precedent natural power of individuals must be referred that right, which some have argued to belong to every state, (though, in fact, never exercised by any), of punishing not only their own subjects, but also foreign ambassadors, even with death itself; in case they have offended, not indeed against the municipal laws of the country, but against the divine laws of nature, and become liable thereby to forfeit their lives for their guilt.

As to offences merely against the laws of society, which are only *mala prohibita*, and not *mala in se*; the temporal magistrate is also empowered to inflict coercive penalties for such transgression: and this by the consent of individuals; who, in forming societies, did either tacitly or expressly invest the sovereign power with a right of making laws, and of enforcing obedience to them when made, by exercising, upon their non-observance, severities adequate to the evil. The lawfulness therefore of punishing such criminals is founded upon this principle, that the law by which they suffer was made by their own consent; it is a

part of the original contract into which they entered, when first they engaged in society; it was calculated for, and has long contributed to, their own security.

This right therefore, being thus conferred by universal consent, gives to the state exactly the same power, and no more, over all its members, as each individual member had naturally over himself or others. Which has occasioned some to doubt, how far a human legislature ought to inflict capital punishments for positive offences; offences against the municipal law only, and not against the law of nature; since no individual has, naturally, a power of inflicting death upon himself or others for actions in themselves indifferent. With regard to offences *mala in se*, capital punishments are in some instances inflicted by the immediate command of God himself to all mankind; as, in the case of murder, by the precept delivered to Noah, their common ancestor and representative, "Whoso sheddeth man's blood, by man shall his blood be shed." In other instances they are inflicted after the example of the Creator, in his positive code of laws for the regulation of the Jewish republic; as in the case of the crime against nature. But they are sometimes inflicted without such express warrant or example, at the will and discretion of the human legislature; as for forgery, for theft, and sometimes for offences of a lighter kind. This practice is thus justified by that great and good man, Sir Matthew Hale: "When offences grow enormous, frequent, and dangerous to a kingdom or state, destructive or highly pernicious to civil societies, and to the great security and danger of the kingdom or its inhabitants, severe punishment and even death itself is necessary to be annexed to laws in many cases by the prudence of lawgivers." It is therefore the enormity, or dangerous tendency, of the crime, that alone can warrant any earthly legislature in putting him to death that commits it. It is not its frequency only, or the difficulty of otherwise preventing it, that will excuse our attempting to prevent it by a wanton effusion of human blood. For, though the end of punishment is to deter men from offending, it never can follow from thence, that it is lawful to deter them at any rate and by any means; since there may be unlawful methods of enforcing obedience even to the justest laws. Every humane legislator will be therefore extremely cautious of establishing laws that inflict the penalty of death, especially for slight offences, or such as are merely positive. He will expect a better reason for his so doing, than that loose one which generally is given; that it is found by former experience that no lighter penalty will be effectual. For is it found upon farther experience, that capital punishments are more effectual? Was the vast territory of all the Russias worse regulated under the late empress Elizabeth, than under her more languinary predecessors? Is it now, under Catherine II. less civilized, less social, less secure? And yet we are assured, that neither of these illustrious princesses have, throughout their whole administration, inflicted the penalty of death: and the latter has, upon full persuasion of its being useless, nay even pernicious, given orders for abolishing it entirely throughout her extensive dominions. But indeed, were capital punishments proved by experience to be

Black?
Comment.

a sure and effectual remedy, that would not prove the necessity (upon which the justice and propriety depend) of inflicting them upon all occasions when other expedients fail. It is feared this reasoning would extend a great deal too far. For instance, the damage done to our public roads by loaded waggons is universally allowed, and many laws have been made to prevent it, none of which have hitherto proved effectual. But it does not therefore follow, that it would be just for the legislature to inflict death upon every obstinate carrier, who defeats or eludes the provisions of former statutes. Where the evil to be prevented is not adequate to the violence of the preventive, a sovereign that thinks seriously can never justify such a law to the dictates of conscience and humanity. To shed the blood of our fellow-creature is a matter that requires the greatest deliberation, and the fullest conviction of our own authority: for life is the immediate gift of God to man; which neither he can resign, nor can it be taken from him, unless by the command or permission of him who gave it, either expressly revealed, or collected from the laws of nature or society by clear and indisputable demonstration.

We would not be understood to deny the right of the legislature in any country to enforce its own laws by the death of the transgressor, though persons of some abilities have doubted it; but only to suggest a few hints for the consideration of such as are, or may hereafter become, legislators. When a question arises, whether death may be lawfully inflicted for this or that transgression, the wisdom of the laws must decide it: and to this public judgment or decision all private judgments must submit; else there is an end of the first principle of all society and government. The guilt of blood, if any, must lie at their doors, who misinterpret the extent of their warrant; and not at the doors of the subjects, who is bound to receive the interpretations that are given by the sovereign power.

2. As to the end, or final cause, of human punishments. This is not by way of atonement or expiation for the crime committed; for that must be left to the just determination of the Supreme Being: but as a precaution against future offences of the same kind. This is effected three ways: either by the amendment of the offender himself; for which purpose all corporeal punishments, fines, and temporary exile or imprisonment, are inflicted: or, by deterring others by the dread of his example from offending in the like way, "ut pœna (as Tully expresses it) ad paucos, "metus ad omnes, perveniat;" which gives rise to all ignominious punishments, and to such executions of justice as are open and public: or, lastly, by depriving the party injuring the power to do future mischief; which is effected by either putting him to death, or condemning him to perpetual confinement, slavery, or exile. The same end, of preventing future crimes, is endeavoured to be answered by each of these three species of punishment. The public gains equal security, whether the offender himself be amended by wholesome correction, or whether he be disabled from doing any farther harm: and if the penalty fails of both these effects, as it may do, still the terror of his example remains as a warning to other citizens. The method however of inflicting punish-

ment ought always to be proportioned to the particular purpose it is meant to serve, and by no means to exceed it: therefore the pains of death, and perpetual disability by exile, slavery, or imprisonment, ought never to be inflicted, but when the offender appears incorrigible: which may be collected either from a repetition of minuter offences; or from the perpetration of some one crime of deep malignity, which of itself demonstrates a disposition without hope or probability of amendment: and in such cases it would be cruelty to the public to defer the punishment of such a criminal till he had an opportunity of repeating perhaps the worst of villainies.

3. As to the measure of human punishments. From what has been observed in the former articles we may collect, that the quantity of punishment can never be absolutely determined by any standing invariable rule; but it must be left to the arbitration of the legislature to inflict such penalties as are warranted by the laws of nature and society, and such as appear to be the best calculated to answer the end of precaution against future offences.

Hence it will be evident, that what some have so highly extolled for its equity, the *lex talionis* or "law of retaliation," can never be in all cases an adequate or permanent rule of punishment. In some cases indeed it seems to be dictated by natural reason; as in the case of conspiracies to do an injury, or false accusations of the innocent; to which we may add that law of the Jews and Egyptians, mentioned by Josephus and Diodorus Siculus, that whoever without sufficient cause was found with any mortal poison in his custody, should himself be obliged to take it. But, in general, the difference of persons, place, time, provocation, or other circumstances, may enhance or mitigate the offence; and in such cases retaliation can never be a proper measure of justice. If a nobleman strikes a peasant, all mankind will see, that if a court of justice awards a return of the blow, it is more than a just compensation. On the other hand, retaliation may sometimes be too easy a sentence; as, if a man maliciously should put out the remaining eye of him who had lost one before, it is too slight a punishment for the maimer to lose only one of his: and therefore the law of the Locrians, which demanded an eye for an eye, was in this instance judiciously altered; by decreeing, in imitation of Solon's laws, that he who struck out the eye of a one-eyed man, should lose both his own in return. Besides, there are very many crimes, that will in no shape admit of these penalties, without manifest absurdity and wickedness. Theft cannot be punished by theft, defamation by defamation, forgery by forgery, adultery by adultery, and the like. And we may add, that those instances, wherein retaliation appears to be used, even by the divine authority, do not really proceed upon the rule of exact retribution, by doing to the criminal the same hurt he has done to his neighbour, and no more; but this correspondence between the crime and punishment is barely a consequence from some other principle. Death is ordered to be punished with death; not because one is equivalent to the other, for that would be expiation, and not punishment. Nor is death always an equivalent for death: the execution of a needy decrepid assassin is a

poor satisfaction for the death of a nobleman in the bloom of his youth, and full enjoyment of his friends, his honours, and his fortune. But the reason upon which this sentence is grounded seems to be, that this is the highest penalty that man can inflict, and tends most to the security of the world; by removing one murderer from the earth, and setting a dreadful example to deter others: so that even this grand instance proceeds upon other principles than those of retaliation. And truly, if any measure of punishment is to be taken from the damage sustained by the sufferer, the punishment ought rather to exceed than equal the injury: since it seems contrary to reason and equity, that the guilty (if convicted) should suffer no more than the innocent has done before him; especially as the suffering of the innocent is past and irrevocable, that of the guilty is future, contingent, and liable to be escaped or evaded. With regard indeed to crimes that are incomplete, which consist merely in the intention, and are not yet carried into act, as conspiracies and the like: the innocent has a chance to frustrate or avoid the villainy, as the conspirator has also a chance to escape his punishment: and this may be one reason why the *lex talionis* is more proper to be inflicted, if at all, for crimes that consist in intention, than for such as are carried into act. It seems indeed consonant to natural reason, and has therefore been adopted as a maxim by several theoretical writers, that the punishment, due to the crime of which one falsely accuses another, should be inflicted on the perjured informer. Accordingly, when it was once attempted to introduce into England the law of retaliation, it was intended as a punishment for such only as preferred malicious accusations against others; it being enacted by statute 37 Edw. III. c. 18. that such as preferred any suggestions to the king's great council should put in furies of taliation; that is, to incur the same pain that the other should have had, in case the suggestion were found untrue. But, after one year's experience, this punishment of taliation was rejected, and imprisonment adopted in its stead.

But though from what has been said it appears, that there cannot be any regular determinate method of rating the quantity of punishments for crimes, by any one uniform rule; but they must be referred to the will and discretion of the legislative power: yet there are some general principles, drawn from the nature and circumstances of the crime, that may be of some assistance in allotting it an adequate punishment.

As, first, with regard to the object of it: for the greater and more exalted the object of an injury is, the more care should be taken to prevent that injury, and of course under this aggravation the punishment should be more severe. Therefore treason in conspiring the king's death is (in Britain) punished with greater rigour than even actually killing any private subject. And yet, generally, a design to transgress is not so flagrant an enormity, as the actual completion of that design. For evil, the nearer we approach it, is the more disagreeable and shocking; so that it requires more obliquity in wickedness

to perpetrate an unlawful action, than barely to entertain the thought of it: and it is an encouragement to repentance and remorse, even till the last stage of any crime, that it never is too late to retract; and that if a man stops even here, it is better for him than if he proceeds: for which reasons an attempt to rob, to ravish, or to kill, is far less penal than the actual robbery, rape, or murder. But in the case of a treasonable conspiracy, the object whereof is the king's majesty, the bare intention will deserve the highest degree of severity: not because the intention is equivalent to the act itself; but because the greatest rigour is no more than adequate to a treasonable purpose of the heart, and there is no greater left to inflict upon the actual execution itself.

Again: The violence of passion, or temptation, may sometimes alleviate a crime; as theft, in case of hunger, is far more worthy of compassion, than when committed through avarice, or to supply one in luxurious excesses. To kill a man upon sudden and violent resentment is less penal than upon cool deliberate malice. The age, education, and character, of the offender; the repetition (or otherwise) of the offence; the time, the place, the company wherein it was committed; all these, and a thousand other incidents, may aggravate or extenuate the crime*.

Farther: As punishments are chiefly intended for the prevention of future crimes, it is but reasonable that among crimes of different natures those should be most severely punished, which are the most destructive of the public safety and happiness: and, among crimes of an equal malignity, those which a man has the most frequent and early opportunities of committing, which cannot be so easily guarded against as others, and which therefore the offender has the strongest inducement to commit: according to what Cicero observes, "*ea sunt animadvertenda peccata maxime, quae diffisillime praecaventur.*" Hence it is, that for a servant to rob his master is in more cases capital, than for a stranger: if a servant kills his master, it is a species of treason; in another it is only murder: to steal a handkerchief, or other trifle of above the value of twelvence, privately from one's person, is made capital; but to carry off a load of corn from an open field, though of fifty times greater value, is punished with transportation only. And, in the island of Man, this rule was formerly carried so far, that to take away an horse or an ox was there no felony, but a trespass, because of the difficulty in that little territory to conceal them or carry them off: but to steal a pig or a fowl, which is easily done, was a capital misdemeanour, and the offender was punished with death.

Lastly, as a conclusion to the whole, we may observe, that punishments of unreasonable severity, especially when indiscriminately inflicted, have less effect in preventing crimes, and amending the manners of a people, than such as are more merciful in general, yet properly intermixed with due distinctions of severity. It is the sentiment of an ingenious writer, who seems to have well studied the springs of human action, that crimes are more effectually prevented by the certain-

* Thus Demosthenes (in his oration against Midias) finely works up the aggravations of the insults he had received. "I was abused, (says he), by my enemy, in cold blood, out of malice, not by heat of wine, in the morning, publicly, before strangers as well as citizens; and that in the temple, whither the duty of my office called me."

ty, than by the severity, of punishment. For the excessive severity of laws (says Montaigne) hinders their execution: when the punishment surpasses all measure, the public will frequently out of humanity prefer impunity to it. Thus also the statute 1 Mar. II. c. 1. recites in its preamble, "that the state of every king consists more assuredly in the love of the subject towards their prince, than in the dread of laws made with rigorous pains; and that laws made for the preservation of the commonwealth without great penalties are more often obeyed and kept, than laws made with extreme punishments." Happy had it been for the nation, if the subsequent practice of that deluded prince in matters of religion, had been correspondent to these sentiments of herself and parliament, in matters of state and government! We may farther observe, that sanguinary laws are a bad symptom of the distemper of any state, or at least of its weak constitution. The laws of the Roman kings, and the twelve tables of the *decemviri*, were full of cruel punishments: the Porcian law, which exempted all citizens from sentence of death, silently abrogated them all. In this period the republic flourished: under the emperors severe punishments were revived; and then the empire fell.

It is moreover absurd and impolitic to apply the same punishment to crimes of different malignity. A multitude of sanguinary laws (besides the doubt that may be entertained concerning the right of making them) do likewise prove a manifest defect either in the wisdom of the legislative, or the strength of the executive, power. It is a kind of quackery in government, and argues a want of solid skill, to apply the same universal remedy, the *ultimum supplicium*, to every case of difficulty. It is, it must be owned, much easier to extirpate than to amend mankind; yet that magistrate must be esteemed both a weak and a cruel surgeon, who cuts off every limb, which through ignorance or indolence he will not attempt to cure. It has been therefore ingeniously proposed, that in every state a scale of crimes should be formed, with a corresponding scale of punishments, descending from the greatest to the least: but, if that be too romantic an idea, yet at least a wise legislator will mark the principal divisions, and not assign penalties of the first degree to offences of an inferior rank. Where men see no distinction made in the nature and gradations of punishment, the generality will be led to conclude there is no distinction in the guilt. Thus in France the punishment of robbery, either with or without murder, is the same: hence it is, that though perhaps they are therefore subject to fewer robberies, yet they never rob but they also murder. In China murderers are cut to pieces, and robbers not: hence in that country they never murder on the highway, though they often rob. And in Britain, besides the additional terrors of a speedy execution, and a subsequent exposure or dissection, robbers have a hope of transportation, which seldom is extended to murderers. This has the same effect here as in China; in preventing frequent assassination and slaughter.

Yet, though in this instance we may glory in the wisdom of our law, we shall find it more difficult to justify the frequency of capital punishment to be

found therein; inflicted (perhaps inattentively) by a multitude of successive independent statutes, upon crimes very different in their natures. It is a melancholy truth, that among the variety of actions which men are daily liable to commit, no less than 160 have been declared by act of parliament to be felonies without benefit of clergy; or, in other words, to be worthy of instant death. So dreadful a list, instead of diminishing, increases the number of offenders. The injured, through compassion, will often forbear to prosecute: juries, through compassion, will sometimes forget their oaths, and either acquit the guilty or mitigate the nature of the offence: and judges, through compassion, will respite one-half of the convicts, and recommend them to the royal mercy. Among so many chances of escaping, the needy and hardened offender overlooks the multitude that suffer; he boldly engages in some desperate attempt, to relieve his wants or supply his vices; and, if unexpectedly the hand of justice overtakes him, he deems himself peculiarly unfortunate, in falling at last a sacrifice to those laws, which long impunity has taught him to contemn.

As to the trials and mode of punishment, see *ARRAIGNMENT*; *TRIAL*, and the references therefrom; *CONVICTION*; *JUDGEMENT*; *ATTAINDER*; *CORRUPTION OF BLOOD*; *FORFEITURE*; *EXECUTION*; the several *Crimes* under their respective names; and *LAW*, Part II. cxxii. *et seq.* and Part III. clxxvi.

Persons capable, or incapable, of committing CRIMES; or (which is all one) of suffering the censures of the law upon the commission of forbidden acts.

All the several pleas and excuses, which protect the committer of a forbidden act from the punishment which is otherwise annexed thereto, may be reduced to this single consideration, the want or defect of *will*. An involuntary act, as it has no claim to merit, so neither can it induce any guilt: the concurrence of the will, when it has its choice either to do or to avoid the fact in question, being the only thing that renders human actions either praise-worthy or culpable. Indeed, to make a complete crime, cognizable by human laws, there must be both a will and an act. For though, in *foro conscientie*, a fixed design or will to do an unlawful act is almost as heinous as the commission of it; yet, as no temporal tribunal can search the heart, or fathom the intentions of the mind, otherwise than as they are demonstrated by outward actions, it therefore cannot punish for what it cannot know. For which reason, in all temporal jurisdictions, an *overt act*, or some open evidence of an intended crime, is necessary, in order to demonstrate the depravity of the will, before the man is liable to punishment. And as a vitious will without a vitious act is no civil crime, so, on the other hand, an unwarrantable act without a vitious will is no crime at all. So that to constitute a crime against human laws, there must be, first, a vitious will; and, secondly, an unlawful act consequent upon such vitious will.

Now there are three cases, in which the will does not join with the act: 1. When there is a defect of understanding. For where there is no discernment, there is no choice; and where there is no choice, there

there can be no act of the will, which is nothing else but a determination of one's choice to do or to abstain from a particular action: he, therefore, that has no understanding, can have no will to guide his conduct. 2. Where there is understanding and will sufficient, refusing in the party; but not called forth and exerted at the time of the action done; which is the case of all offences committed by chance or ignorance. Here the will fits neuter; and neither concurs with the act, nor disagrees to it. 3. Where the action is constrained by some outward force and violence. Here the will counteracts the deed; and is so far from concurring with, that it loaths and disagrees to, what the man is obliged to perform. Infancy, idiocy, lunacy, and intoxication, fall under the first class; misfortune, and ignorance may be referred to the second; and compulsion or necessity may properly rank in the third. See INFANCY, IDIOCY, DRUNKENNESS, MISFORTUNE, IGNORANCE, NECESSITY.

CRIMSON, one of the seven red colours of the dyes. See DYING.

CRINGLE, a small hole made in the bolt-rope of a sail, by intertwining one of the divisions of a rope, called a *strand*, alternately round itself and through the *strands* of the bolt-rope, till it becomes threefold, and assumes the shape of a wreath or ring. The use of the cringle is generally to contain the end of some rope, which is fastened thereto for the purpose of drawing up the sail to its yard, or of extending the skirts by the means of *bridles*, to stand upon a side wind. The word seems to be derived from *krinckelen* (Belg.) to run into twists.

CRINUM, ASPHODEL-LILY; a genus of the monogynia order, belonging to the hexandria class of plants. They are very beautiful green-house plants, rising two or three feet high, each of them crowned by a large umbellate cluster of spathaceous, monopetalous, long funnel-shaped flowers; blue, white, or striped, having a very fragrant smell. They are propagated by off-sets.

CRISIS, in medicine, is used in different senses, both by the ancient and modern physicians. With some it means frequently no more than the excretion of any noxious substance from the body. Others take the word for a secretion of the noxious humours made in a fever. Others use it for the critical motion itself; and Galen defines a crisis in fevers, a sudden and instantaneous change, either for the better or the worse, productive of recovery or death.

CRISTÆ, in surgery, a term for certain excrescences about the anus and pudenda. See (the *Index* subjoined to) MEDICINE.

CRISTA GALLI. See ANATOMY, n° 16. b.

CRITERION, or CRITERIUM, a standard by which propositions and opinions are compared, in order to discover their truth or falsehood.

CRITHE, in surgery, commonly called the *fly*, is a sort of tubercle that grows on the eye-lids. When small, it is seated on the edge of the eye-lid; but when large, it spreads further. When they do not suppurate, they become wens. They are apt to disappear and return. If there is inflammation, endeavour to suppurate it with the white-bread poultice: if it is hard, destroy it with a mixture of equal parts of

hog's lard and quicksilver. If the lower eye-lid is affected, the tumour is more frequently on its inside; and then it is best to dissect it, or to make way for it outwardly by applying a caustic on the skin just upon it.

CRITHMUM, SAMPHIRE; a genus of the digynia order, belonging to the pentandria class of plants. There are two species, the principal of which is the maritimum, or common maritime samphire. It hath a fibrous penetrating root; thick, succulent, branchy stalks rising two feet high, winged fleshy leaves consisting of many small spear-shaped lobes; with round yellow flowers growing in umbels. It is produced naturally on the sea-coasts among the gravel and rocks. Its leaves are an excellent pickle used for sauces, and are by many eaten raw in salads. It is of a saltish relish, palatable, and comfortable to the stomach. It is not very easily preserved in gardens. It must be sown on gravelly or rocky ground, half an inch deep; in which situation the plants will come up, and last some years. The leaves of this plant are said also to be aperient and diuretic.

CRITICAL DAYS AND SYMPTOMS, among physicians, are certain days and symptoms in the course of acute diseases, which indicate the patient's state, and determine him either to recover or grow worse. See (*Index* subjoined to) MEDICINE.

CRITICISM, the art of judging with propriety concerning any object or combination of objects. But, in a more limited sense, the science of criticism is confined to the fine arts. The principles of the fine arts are best unfolded by studying the sensitive part of our nature, and by learning what objects are naturally agreeable, and what are naturally disagreeable. The man who aspires to be a critic in these arts, must pierce still deeper: he must clearly perceive what objects are lofty, what low, what are proper or improper, what are many, and what are mean or trivial. Hence a foundation for judging of taste, and for reasoning upon it: where it is conformable to principles, we can pronounce with certainty, that it is correct; otherwise, that it is incorrect, and perhaps whimsical. Thus the fine arts, like morals, become a rational science; and, like morals, may be cultivated to a high degree of refinement.

Manifold are the advantages of criticism, when thus studied as a rational science. In the first place, a thorough acquaintance with the principles of the fine arts, redoubles the entertainment these arts afford. To the man who resigns himself entirely to sentiment or feeling, without interposing any sort of judgment, poetry, music, painting, are mere pastime; in the prime of life, indeed, they are delightful, being supported by the force of novelty, and the heat of imagination; but they lose their relish gradually with their novelty; and are generally neglected in the maturity of life, which disposes to more serious and more important occupations. To those who deal in criticism as a regular science, governed by just principles, and giving scope to judgment as well as to fancy, the fine arts are a favourite entertainment; and in old age maintain that relish which they produce in the morning of life.

In the next place, a philosophical inquiry into the principles

Crithmum
|
Criticism.

Criticism.

principles of the fine arts, inures the reflecting mind to the most enticing sort of logic: the practice of reasoning upon subjects so agreeable tends to a habit; and a habit strengthening the reasoning faculties, prepares the mind for entering into subjects more difficult and abstract. To have, in this respect, a just conception of the importance of criticism, we need but reflect upon the common method of education; which, after some years spent in acquiring languages, hurries us, without the least preparatory discipline, into the most profound philosophy: a more effectual method to alienate the tender mind from abstract science, is beyond the reach of invention: and accordingly, with respect to such speculations, the bulk of our youth contract a sort of hobgoblin terror, which is seldom, if ever subdued. Those who apply to the arts, are trained in a very different manner: they are led, step by step, from the easier parts of the operation, to what are more difficult; and are not permitted to make a new motion, till they be perfected in those which regularly precede it. The science of criticism appears then to be a middle link, connecting the different parts of education into a regular chain. This science furnisheth an inviting opportunity to exercise the judgment: we delight to reason upon subjects that are equally pleasant and familiar; we proceed gradually from the simpler to the more involved cases: and in a due course of discipline, custom, which improves all our faculties, bestows acuteness upon those of reason, sufficient to unravel all the intricacies of philosophy.

Nor ought it to be overlooked, that the reasonings employed upon the fine arts are of the same kind with those which regulate our conduct. Mathematical and metaphysical reasonings have no tendency to improve social intercourse; nor are they applicable to the common affairs of life: but a just taste in the fine arts, derived from rational principles, furnishes elegant subjects for conversation, and prepares us finely for acting in the social state with dignity and propriety.

The science of rational criticism tends to improve the heart not less than the understanding. It tends, in the first place, to moderate the selfish affections: by sweetening and harmonizing the temper, it is a strong antidote to the turbulence of passion and violence of pursuit: it procures to a man so much mental enjoyment, that in order to be occupied, he is not tempted in youth to precipitate into hunting, gaming, drinking; nor in middle-age, to deliver himself over to ambition; nor in old-age, to avarice. Pride and envy, two disgusting passions, find in the constitution no enemy more formidable than a delicate and discerning taste: the man upon whom nature and culture have bestowed this blessing, feels great delight in the virtuous dispositions and actions of others: he loves to cherish them, and to publish them to the world: faults and failings, it is true, are to him not less obvious; but these he avoids, or removes out of sight, because they give him pain. On the other hand, a man void of taste, upon whom the most striking beauties make but a faint impression, has no joy but in gratifying his pride or envy by the discovery of errors and blemishes. In a word, there may be other passions, which, for a season, disturb the peace of society more than those men-

tioned; but no other passion is so unwearied an antagonist to the sweets of social intercourse: these passions, tending assiduously to their gratification, put a man perpetually in opposition to others; and dispose him more to relish bad than good qualities, even in a companion. How different that disposition of mind, where every virtue in a companion or neighbour, is, by refinement of taste, set in its strongest light; and defects or blemishes, natural to all, are suppressed, or kept out of view!

In the next place, delicacy of taste tends not less to invigorate the social affections, than to moderate those that are selfish. To be convinced of this tendency, we need only reflect, that delicacy of taste necessarily heightens our sensibility of pain and pleasure, and of course our sympathy, which is the capital branch of every social passion. Sympathy, in particular, invites a communication of joys and sorrows, hopes and fears: such exercise, soothing and satisfactory in itself, is necessarily productive of mutual good-will and affection.

One other advantage of rational criticism is referred to the last place, being of all the most important; which is, that it is a great support to morality. No occupation attaches a man more to his duty than that of cultivating a taste in the fine arts: a just relish of what is beautiful, proper, elegant, and ornamental, in writing or painting, in architecture or gardening, is a fine preparation for the same just relish of these qualities in character and behaviour. To the man who has acquired a taste so acute and accomplished, every action wrong or improper, must be highly disgusting: if, in any instance, the overbearing power of passion sway him from his duty, he returns to it upon the first reflection, with redoubled resolution never to be swayed a second time: he has now an additional motive to virtue, a conviction derived from experience, that happiness depends on regularity and order, and that a disregard to justice or propriety never fails to be punished with shame and remorse.

For the rules of criticism, applicable to the fine arts, and derived from human nature, see ARCHITECTURE, BEAUTY, CONGRUITY, COMPARISON, GRANDEUR, &c.

CRITO, an Athenian philosopher, flourished 400 years before Christ. He was one of the most zealous disciples of Socrates, and supplied him with whatever he wanted. He had several scholars who proved great men, and he composed some dialogues which are lost.

CROATIA, a part of the ancient Illyricum, is bounded on the east by Slavonia and Bosnia, on the south and south-west by Morlachia, and on the north by the Drave, which separates it from a part of Slavonia. It is about 80 miles in length, and 70 in breadth; and was once divided between the Hungarians and Turks; but now the greatest part of it is subject to the house of Austria. The Croats derive their origin from the Slavi; and their language is a dialect of the Slavonian, approaching very near to that of the Poles. The country is divided into two parts; viz. that under, and that beyond, the Save. In the late wars between the empress queen and the king of Prussia, no less than 50,000 men were raised out of this small territory. Both horse and foot are good soldiers, especially the former.

The

Crito
Croatia.

Crocodylus. The foil, where cultivated, is fruitful in wine and oil, &c. but being a frontier country, and much exposed to inroads, it is not so well cultivated as otherwise it might be.

CROCODYLE, in zoology. See **LACERTA**.

Fossile CROCODYLE, one of the greatest curiosities in the fossile world which the late ages have produced. It is the skeleton of a large crocodile, almost entire, found at a great depth under ground, bedded in stone. This was in the possession of Linkius, who wrote many pieces of natural history, and particularly an accurate description of this curious fossile. It was found in the side of a large mountain in the midland part of Germany, and in a stratum of black fossile stone, somewhat like our common slate, but of a coarser texture, the same with that in which the fossile fish in many parts of the world are found. This skeleton had the back and ribs very plain, and was of a much deeper black than the rest of the stone; as is also the case in the fossile fishes which are preserved in this manner. The part of the stone where the head lay was not found; this being broken off just at the shoulders, but that irregularly; so that, in one place, a part of the back of the head was visible in its natural form. The two shoulder bones were very fair, and three of the feet were well preserved; the legs were of their natural shape and size, and the feet preserved even to the extremities of the five toes of each.

CROCUS, SAFFRON; a genus of the monogynia order, belonging to the triandria class of plants. Modern botanists allow only one species of this genus, which, however, comprehends many beautiful varieties. This hath a small roundish, brown, bulbous root, compressed at the bottom. Directly from the root issue many long narrow leaves, of a deep green colour; and amidst them the flowers all protruded from a thin univalvular, radical spatula; the tube of the flower is long, standing on the root, and serving as a foot-stalk to the limb, or upper part, which is erect, six-parted, widens gradually upward, and grows from about three to five or six inches high. The varieties of this species may be divided into two classes, the autumnal and spring flowering.

The varieties of the first are the *crocus officinalis*, or saffron of the shops; for the properties of which, and its cultivation for sale, see the article **SAFFRON**. This hath a long-tubed bluish purple flower, with three stigmata of a fine golden colour. Other varieties are the autumnal small blue crocus; deep blue, sky-blue, whitish blue, many-flowered whitish blue, purple, large rush-leaved purple, autumnal white crocus, and autumnal yellow crocus. The varieties of the vernal crocus are, the small and large, and golden yellow crocuses, and the yellow black-striped, the yellow purple-striped and double cloth of gold ones; the white, white purple-striped, white purple bottom, white black-striped, whitish cream-coloured, whitish ash-coloured, little narrow-leaved white, and white blue-striped crocuses. Besides these there are a great many others of a blue and purple colour finely variegated.

The autumnal crocuses flower about the beginning of October, but never ripen their seeds in this country. They are very beautiful if sown in patches in

the front of borders or in beds by themselves, and every proper ornaments for gardens of every extent, as coming up at a time when most other flowers are on the decay. They grow freely in any kind of foil, and may be propagated by offsets. The vernal kinds flower in February, March, and April. They also are very ornamental, and are so hardy that they will grow almost any where. They are propagated by seeds, which the plants produce in plenty.

CROCUS, in chemistry, denotes any metal calcined to a red or deep yellow colour.

CROCUS Metallorum, an emetic preparation of antimony and nitre. See **CHEMISTRY**, n° 459.

CRÆSUS, the fifth and last king of Lydia, 544 B. C. He made the Greeks of Asia tributary; subdued the Phrygians, Mysians, Paphlagonians, Thracians, and Carians; amassed together immense riches; and became one of the most powerful and magnificent princes in the world. He drew the learned to his court, and took a pleasure in conversing with them. One day as he was enumerating his riches, and magnifying the felicity of his reign, Solon gave a check to his vanity, by saying, that we ought to consider no man happy before his death. Cræsus ridiculed this reflection, but soon he himself experienced its truth: for, being defeated by Cyrus, he shut himself up in Sardis, the capital of his empire. The city was taken by assault; and, as a Persian soldier was going to kill Cræsus, that prince's only surviving son, who had hitherto been dumb, terrified at his danger, cried, *Stop, soldier, and lay not thy hand on Cræsus*. Cræsus was then conducted to Cyrus, who caused him to be laid on a funeral pile; when, reflecting on Solon's words, he cried, *O Solon, Solon!* Cyrus desired to know what he meant; and, being told the reason of this exclamation, was so moved, that he recalled his sentence, and treated him with great respect.

CROFT, a little clole adjoining to a dwelling-house, and inclosed for pasture or arable land, or any other purpose.

CROISADE, or CRUSADE, a name given to the expeditions of the Christians against the infidels for the conquest of Palestine.

These expeditions commenced in the year 1091. The foundation of them was a superstitious veneration for those places where our Saviour performed his miracles, and accomplished the work of man's redemption. Jerusalem had been taken, and Palestine conquered, by Omar the successor of Abu Becr*, who succeeded Mahomet himself. This proved a considerable interruption to the pilgrims, who flocked from all quarters to perform their devotions at the holy sepulchre. They had, however, still been allowed this liberty, on paying a small tribute to the Saracen caliphs, who were not much inclined to molest them. But, in 1055, this city changed its masters. The Turks took it from the Saracens; and being much more fierce and barbarous than the former, the pilgrims now found they could no longer perform their devotions with the same safety they did before. An opinion was about this time also prevalent in Europe, which made these pilgrimages much more frequent than formerly. It was somehow or other imagined, that the thousand years mentioned in the 20th chapter

Crocus

Croisade.

of the Revelations, were fulfilled; that Christ was soon to make his appearance in Palestine, to judge the world; and consequently that journeys to that country were in the highest degree meritorious, and even absolutely necessary. The multitudes of pilgrims which now flocked to Palestine meeting with a very rough reception from the Turks, filled all Europe with complaints against those infidels who profaned the holy city by their presence, and derided the sacred mysteries of Christianity even in the place where they were fulfilled. Pope Gregory VII. had formed a design of uniting all the princes of Christendom against the Mahometans; but his exorbitant encroachments upon the civil power of princes had created him so many enemies, and rendered his schemes so suspicious, that he was not able to make great progress in this undertaking. The work was reserved for a meaner instrument.

Peter, commonly called the *hermit*, a native of Amiens in Picardy, had made the pilgrimage to Jerusalem; and being deeply affected with the dangers to which that act of piety now exposed the pilgrims, as well as with the oppression under which the eastern Christians now laboured, formed the bold, and, in all appearance, impracticable design of leading into Asia, from the farthest extremities of the West, armies sufficient to subdue those potent and warlike nations that now held the Holy Land in slavery. He proposed his scheme to Martin II. who then filled the papal chair; but he, though sensible enough of the advantages which must accrue to himself from such an undertaking, resolved not to interpose his authority till he saw a greater probability of success. He summoned, at Placentia, a council consisting of 4000 ecclesiastics, and 30,000 seculars. As no hall could be found large enough to contain such a multitude, the assembly was held in a plain. Here the Pope himself, as well as Peter, harangued the people, representing the dismal situation of their brethren in the East, and the indignity offered to the Christian name in allowing the holy city to remain in the hands of the infidels. These speeches were so agreeable to those who heard them, that the whole multitude suddenly and violently declared for the war, and solemnly devoted themselves to perform this service, which they believed to be so meritorious in the sight of God.

But though Italy seemed to have embraced the design with ardour, Martin yet thought it necessary, in order to insure perfect success, to engage the greater and more warlike nations in the same enterprise. Having therefore exhorted Peter to visit the chief cities and sovereigns of Christendom, he summoned another council at Clermont in Auvergne. The fame of this great and pious design being now universally diffused, procured the attendance of the greatest prelates, nobles, and princes; and when the Pope and the hermit renewed their pathetic exhortations, the whole assembly, as if impelled by an immediate inspiration, exclaimed with one voice, "It is the will of God! it is the will of God!" These words were deemed so memorable, and so much the effect of a divine impulse, that they were employed as the signal of rendezvous and battle in all future exploits of these adventurers. Men of all ranks now flew to arms with the utmost

ardour, and a cross was affixed to their right shoulder by all who enlisted in this holy enterprise.

At this time Europe was sunk in the most profound ignorance and superstition. The ecclesiastics had gained the greatest ascendancy over the human mind; and the people, who committed the most horrid crimes and disorders, knew of no other expiation than the observances imposed on them by their spiritual pastors.

But amidst the abject superstition which now prevailed, the military spirit had also universally diffused itself; and, though not supported by art or discipline, was become the general passion of the nations governed by the feudal law. All the great lords possessed the right of peace and war. They were engaged in continual hostilities with one another: the open country was become a scene of outrage and disorder: the cities, still mean and poor, were neither guarded by walls, nor protected by privileges. Every man was obliged to depend for safety on his own force, or his private alliances; and valour was the only excellence which was held in esteem, or gave one man the pre-eminence above another. When all the particular superstitions, therefore, were here united in one great object, the ardour for private hostilities took the same direction; "and all Europe, (as the princess Anna Commena expresses herself), torn from its foundations, seemed ready to precipitate itself in one united body upon Asia."

All orders of men, now deeming the croisades the only road to heaven, were impatient to open the way with their swords to the holy city. Nobles, artisans, peasants, even priests, enrolled their names; and to decline this service was branded with the reproach of impurity or cowardice. The nobles who enlisted themselves were moved, by the romantic spirit of the age, to hope for opulent establishments in the East, the chief seat of arts and commerce at that time. In pursuit of these chimerical projects, they sold at the lowest price their ancient castles and inheritances, which had now lost all value in their eyes. The infirm and aged contributed to the expedition by presents and money; and many of them, not satisfied with this, attended it in person, being determined, if possible, to breathe their last in fight of that city where their Saviour had died for them. Women themselves, concealing their sex under the disguise of armour, attended the camp; and commonly forgot their duty still more, by prostituting themselves to the army. The greatest criminals were forward in a service which they considered as an expiation for all crimes; and the most enormous disorders were, during the course of these expeditions, committed by men inured to wickedness, encouraged by example, and impelled by necessity. The multitude of adventurers soon became so great, that their more sagacious leaders became apprehensive lest the greatness of the armament would be the cause of its own disappointment. For this reason they permitted an undisciplined multitude, computed at 300,000 men, to go before them under the command of Peter the hermit, and *Gautier*, or *Walter*, surnamed "the moneyless," from his being a soldier of fortune. These took the road towards Constantinople, through Hungary and Bulgaria; and, trusting that heaven, by supernatural assistance, would supply

Croisade.

Croisade. supply all their necessities, they made no provision for subsistence on their march. They soon found themselves obliged to obtain by plunder what they vainly expected from miracles; and the enraged inhabitants of the countries through which they passed, attacked the disorderly multitude, and slaughtered them without resistance. The more disciplined armies followed after; and, passing the straits at Constantinople, they were mustered in the plains of Asia, and amounted in the whole to 700,000 men.

This rage for conquering the Holy Land did not cease with this expedition. It continued for very near two centuries, and eight different croisades were set on foot, one after another. The first was in the year 1096, as already observed. The princes engaged in it were, Hugo, count of Vermandois, brother to Philip I. king of France; Robert, duke of Normandy; Robert, earl of Flanders; Raimond, earl of Toulouse and St Giles; Godfrey of Bouillon, duke of Lorrain, with his brothers Baldwin and Eustace; Stephen, earl of Chartres and Blois; Hugo, count of St Paul; with a great number of other lords. The general rendezvous was at Constantinople. In this expedition, the famous Godfrey besieged and took the city of Nice. The city of Jerusalem was taken by the confederated army, and Godfrey chosen king. The Christians gained the famous battle of Ascalon against the sultan of Egypt; which put an end to the first croisade.

The second croisade, in the year 1144, was headed by the emperor Conrad III. and Lewis VII. king of France. The emperor's army was either destroyed by the enemy, or perished through the treachery of Manuel the Greek emperor; and the second army, through the unfaithfulness of the Christians of Syria, was forced to break up the siege of Damascus.

The third croisade, in the year 1188, immediately followed the taking of Jerusalem by Saladin the sultan of Egypt. The princes engaged in this expedition were, the emperor Frederic Barbarossa; Frederic, duke of Suabia, his second son; Leopold, duke of Austria; Berthold, duke of Moravia; Herman, marquis of Baden; the counts of Nassau, Thuringia, Misson, and Holland; and above 60 other princes of the empire; with the bishops of Befançon, Cambrai, Munster, Osnaburg, Misson, Passau, Wisburg, and several others. In this expedition, the emperor Frederic defeated the sultan of Iconium: his son Frederic, joined by Guy Lusignan, king of Jerusalem, in vain endeavoured to take Acre, or Ptolemais. During which transactions, Philip Augustus, king of France, and Richard II. king of England, joined the croisade; by which means the Christian army consisted of 300,000 fighting men: but, great disputes happening between the kings of France and England, the former quitted the Holy Land, and Richard concluded a peace with Saladin.

The fourth croisade was undertaken, in the year 1195, by the emperor Henry VI. after Saladin's death. In this expedition, the Christians gained several battles against the infidels, took a great many towns, and were in the way of success, when the death of the emperor obliged them to quit the Holy Land, and return into Germany.

VOL. III.

The fifth croisade was published, by order of Pope Innocent III. in 1198. Those engaged in it made fruitless efforts for the recovery of the Holy Land: for, though John de Neule, who commanded the fleet equipped in Flanders, arrived at Ptolemais a little after Simon of Montfort, Renard of Dampierre, and others; yet the plague destroying many of them, and the rest either returning, or engaging in the petty quarrels of the Christian princes, there was nothing done; so that the sultan of Aleppo easily defeated their troops in 1204.

The sixth croisade began in 1228; in which the Christians took the town of Damietta, but were forced to surrender it again. The next year, the emperor Frederic made peace with the sultan for 10 years. About 1240, Richard, earl of Cornwall, and brother to Henry III. king of England, arrived in Palestine, at the head of the English croisade; but, finding it most advantageous to conclude a peace, he embarked, and steered towards Italy. In 1244, the Karafmians being driven out of Perlia by the Tartars, broke into Palestine, and gave the Christians a general defeat near Gaza.

The seventh croisade was headed by St Lewis, in the year 1249, who took the town of Damietta: but a sickness happening in the Christian army, the king endeavoured a retreat; in which being pursued by the infidels, most of his army were miserably butchered, and himself and the nobility taken prisoners. Then a truce was agreed upon for 10 years, and the king and lords set at liberty.

The eight croisade, in 1270, was headed by the same prince, who made himself master of the port and castle of Carthage, in Africa; but, dying in a short time, he left his army in a very ill condition. Soon after, the king of Sicily coming up with a good fleet, and joining Philip the bold, son and successor of Lewis the king of Tunis, after several engagements with the Christians, in which he was always worsted, desired peace, which was granted upon conditions advantageous to the Christians: after which, both princes embarked for their own kingdoms. Prince Edward of England, who arrived at Tunis at the time of this treaty, sailed towards Ptolemais, where he landed with a small body of 300 English and French, and hindered Bendocdar from laying siege to Ptolemais: but, being obliged to quit the Holy Land to take possession of the crown of England, this croisade ended, without contributing any thing to the recovery of the Holy Land. In 1291, the town of Acre, or Ptolemais, was taken and plundered by the sultan of Egypt, and the Christians quite driven out of Syria. There has been no croisade since that time, though several popes have attempted to stir up the Christians to such an undertaking; particularly Nicholas IV. in 1292, and Clement V. in 1311.

Though these croisades were effects of the most absurd superstition, they tended greatly to promote the good of Europe. Multitudes indeed were destroyed. M. Voltaire computes the people who perished in the different expeditions at upwards of two millions. Many there were, however, who returned; and these, having conversed so long with people who lived in a much more magnificent way than themselves, began to entertain some taste for a refined and polished way

Croifade of life. Thus the barbarism in which Europe had been so long immerfed, began to wear off foon after this time. The princes alfo who remained at home, found means to avail themfelves of the frenzy of the people. By the abfence of fuch numbers of refflefs and martial adventurers, peace was eftablifhed in their dominions. They alfo took the opportunity of annexing to their crown many confiderable fiefs, either by purchafe, or by the extinction of the heirs; and thus the mifchiefs which muft always attend feudal governments were confiderably leffened.

With regard to the bad fucceds of the croifaders, it was fcarce poffible that any other thing could happen them. The emperors of Conftantinople, inftead of affifting, did all in their power to difconcert their fchemes. They were jealous, and not without reafon, of fuch an inundation of barbarians. Yet, had they confidered their true intereft, they would rather have affifted them, or at leaft flood neuter, than entered into alliances with the Turks. They followed the latter method, however, and were often of very great difervice to the weftern adventurers, which at laft occafioned the lofs of their city *. But the worft enemies the croifaders had, were their own internal feuds and diffentions. They neither could agree while marching together in armies with a view to conqueft, nor could they unite their conquefts under one government after they had made them. They fet up three fmall ftates, one at Jerufalem, another at Antioch, and another at Edeffa. Thefe ftates, inftead of affifting, made war upon each other, and on the Greek emperors; and thus became an eafy prey to the common enemy. The horrid cruelties they committed alfo were fuch as muft have infpired the Turks with the moft invincible hatred againft them, and made them refift with the greateft obftinacy. They were fuch as could have been committed only by barbarians inflamed with religious enthufiafm. When Jerufalem was taken, not only the numerous garrifon were put to the fword, but the inhabitants were maffaced without mercy, and without diftinction. No age nor fex was fpared, not even fucking children. According to Voltaire, fome Chriftians, who had been fuffered by the Turks to live in that city, led the conquerors into the moft private caves where women had concealed themfelves with their children, and not one of them was fuffered to efcape. What eminently fhews the enthufiafm by which thefe conquerors were animated, is their behaviour after this terrible flaughter. They marched over heaps of dead bodies towards the holy fepulchre; and while their hands were yet polluted with the blood of fo many innocent perfons, fang anthems to the common Saviour of mankind. Nay, fo far did their religious enthufiafm overcome their fury, that thefe ferocious conquerors now burft into tears. If the abfurdity and wickednefs of this conduct can be exceeded by any thing, it muft be by what follows. In the year 1204, the frenzy of croifading feized the children, who are ever ready to imitate what they fee their parents engage themfelves in. Their childifh folly was encouraged by the monks and fchoolmafters; and thoufands of thofe innocents were conducted from the houfes of their parents on the faith of thefe words, "Out of the mouth of babes and fucklings haft thou

perfected praife." Their bafe conductors fold a part of them to the Turks, and the reft perifhed miferably.

CROISES, or **CROIZES**, in English antiquity, pilgrims bound for the Holy Land, or fuch as had been there; fo called from a badge they wore in imitation of a crofs. The knights of St John of Jerufalem, created for the defence and protection of pilgrims, were particularly called *croifes*.

CROISIERS, a religious order founded in honour of the invention or difcovery of the crofs by the empress Helena. They are difperfed in feveral parts of Europe, particularly in the Low Countries, France, and Bohemia, thofe in Italy being at prefent fuppreffed. Thefe religious follow the rule of St Auguftine. They had in England the name of *crouched friers*.

CROMARTY, the capital of the fhire of Cromarty, in Scotland, with an excellent and fafe harbour capable of containing the greateft fleets. W. Long. 3. 40. N. Lat. 57. 54.

CROMWELL (Thomas), earl of Effex, was the fon of a blackfmith at Putney, and born in 1498. Without a liberal education, but endowed with a ftrong natural genius, he confidered travelling as the proper means of improving his underftanding; and to this early token of his found judgement he flood indebted for the high rank and diftinguifhed honours he afterwards enjoyed. He became by degrees the confidential favourite, and prime minifter of Henry VIII.; and from the moment he acquired any authority in the cabinet, he employed it in promoting the reformation, to his zeal for which he became a victim; for, the more firmly to fecure the proteftant caufe, he contrived to marry the king to Ann of Cleves, whose friends were all Lutherans. Unfortunately Henry took a difguft to this lady, which brought on Cromwell's ruin; the king, with his ufual cruelty and caprice, taking this opportunity to facifice this minifter to the Roman Catholic party, to whom he feemed defirous of reconciling himfelf as foon as he had Catharine Howard in view. Cromwell was a great politician, and a good man; but, like moft ftatefmen, was guilty of great errors. In his zeal for the new religion, he had introduced the unjuftifiable mode of attainting in cafes of treafon and herefy; and his enemies, who were numerous, (confifting of two claffes, the ancient nobility and gentry, who were enraged to fee the higheft honours beftowed on a man of his mean extraction, and the Roman Catholics, who detefted him), having preferred many complaints againft him, availed themfelves of his own law. He was attainted of treafon and herefy, convicted unheard, and beheaded in 1540. He was the chief instrument of the fuppreffion of the abbeyes and monafteries, and of the deftruction of images and relics; to him alfo we are indebted for the institution of parifh-regifters of births, marriages, and burials.

CROMWELL (Oliver), ftyled *Lord Protector* of the commonwealth of England, one of the moft extraordinary perfonages mentioned in hiftory, was the fon of Mr Robert Cromwell of Hinchinbrooke in the county of Huntingdon. His anceftors were of very honourable extraction; but no ways related to Thomas Cromwell earl of Effex, the prime minifter and favourite

* See Conftantinople, n^o 149.

Cromwell.

favourite of Henry VIII. He was born in the parish of St John, Huntingdon, where his father mostly lived, on the 24th or 25th of April 1599, and educated at the free school of that town. Little is known concerning him in his younger years, or indeed concerning his behaviour in private life. It is, however, related by authors of unqualified veracity, that when at school he gave many signs of a very turbulent and restless disposition. He is also said from his early years to have been subject to the hypochondriac disorder, and to many deceptions of the imagination. He had a very remarkable one while at school. It happened in the day time, when he was lying melancholy upon his back in bed. A spectre, as he thought, approached him, and told him that he should be the greatest man in the kingdom. His father, being informed of this, was very angry, and desired his master to correct him severely. This, however, produced no effect. Oliver persisted in the truth of his story, and would sometimes mention it though his uncle told him "it was too traitorous to be repeated."—From this school, Oliver was removed to Sidney-college in Cambridge, where he was admitted in 1616. His progress in his studies is uncertain; but he spent much time in playing at foot-ball, cricket, and other robust exercises, at which he was very expert. His father dying after he had been about two years at college, Cromwell returned home; but the irregularity of his life gave such offence to his mother, that, by the advice of some friends, she sent him to London, and placed him in Lincoln's-inn. This expedient by no means answered the purpose; for he gave himself up to gaming, wine, and women, so that he quickly dissipated all that was left him by his father. This dissipation, however, could be but of very short continuance; for he was married, before he was 21 years of age, to Elizabeth, daughter of Sir James Bouchier of Essex. Soon after his marriage he returned to the country, where he led a very grave and sober life. This sudden reformation has been ascribed to his falling in with the Puritans; but it is certain, that Mr Cromwell continued then, and for some time after, a zealous member of the church of England, and formed a close friendship with several eminent divines. He continued at Huntingdon where he settled after his marriage, till an estate of between L. 400 and L. 500 *per annum* devolved to him by the death of his uncle Sir Thomas Stuart. This induced him to remove to the Isle of Ely where the estate lay, and here he embraced the puritanical doctrines. He was elected a member of the third parliament of Charles I. which met on the 20th of January 1628; and was a member of the committee for religion, where he distinguished himself by his zeal against popery. After the dissolution of that parliament, he returned again into the country, where he continued to express much concern for religion, to keep company with silenced ministers, and to invite them often to lectures and sermons at his house. Thus he brought his affairs again into a very indifferent situation; so that, by way of repairing the breaches he made in his fortune, he took a farm at St Ives, which he kept five years. But this scheme succeeded so ill, that he was obliged to give it up; and at last, chagrined with his disappointments,

and made uneasy by the treatment his party at that time received, he formed a design of going over to New-England. In this, however, he was disappointed; the king issued out a proclamation against all such emigrations, and Cromwell was obliged to remain in England against his will.

In 1638, Cromwell had first an opportunity of getting himself publicly taken notice of. The earl of Bedford, and some other persons of high rank, who had estates in the fen country, were very desirous of having it better drained; and, though one project of this sort had failed, they set on foot another, got it countenanced by royal authority, and settled a part of the profits upon the crown. This, though really intended for a public benefit, was opposed as injurious to private property; and at the head of the opposers was Mr Oliver Cromwell, who had considerable influence in these parts. The vigour he shewed on this occasion recommended him to his friend and relation Mr Hampden; who afterwards characterized him in parliament, as a person capable of contriving and conducting great designs. But for all this he was not very successful in his opposition; and as his private affairs were still declining, he was in very necessitous circumstances at the approach of the long parliament. In this critical situation he got himself elected member of parliament in the following manner. In the puritanical meetings which he constantly frequented, Oliver had most eminently distinguished himself by his gifts of praying, preaching, and expounding. At one of these meetings, he met with one Richard Tims a tradesman of Cambridge. This man was so much taken with Oliver, that he took it into his head to attempt getting him chosen burgess for the approaching parliament. Being himself one of the common council, Tims imagined this design might be brought about; and with this view went to Mr Wildbore a relation of Cromwell's, to whom he communicated his intention. Wildbore agreed as to the fitness of the person; but told him the design was impracticable, because Oliver was not a freeman. Tims next addressed one Evert on the same subject, who also made the same objection. He recollected, however, that the mayor had a freedom to bestow, and a scheme was immediately laid for securing this freedom to Cromwell. On application to the mayor, however, he told them that the freedom was already disposed of to another; but this objection being obviated by promising that person a freedom from the town, the mayor, being informed that Cromwell was a man of great fortune, signified his intention of bestowing the freedom upon him. Our hero, being informed of the good offices of his friends, made his appearance in the court dressed in scarlet richly laced with gold, and having provided plenty of claret and sweetmeats, they were so freely circulated among the corporation, that Mr Mayor's freeman was unanimously declared to be a very civil worthy gentleman. When the election came on, the mayor discovered his mistake, but it was now too late; the party among the burgesses was strong enough to choose him, and accordingly did so at the election next year.

When Cromwell first came into parliament, he affected great plainness, and even carelessness, in his dress. His attention to farming had entirely rusticated him,

Cromwell. so that he made a very uncouth appearance. "Who (says Dr South) that had beheld such a bankrupt, beggarly fellow, as Cromwell, first entering the parliament house, with a thread-bare torn coat and greasy hat, and perhaps neither of them paid for, could have suspected, that, in the space of so few years, he should, by the murder of one king, and the banishment of another, ascend the throne, be invested with the royal robes, and want nothing of the state of a king but the changing his hat into a crown?" Cromwell was very active in promoting the famous *Remonstrance**, which in reality laid the foundation of the civil war. He declared afterwards to lord Falkland, that if the remonstrance had not been carried, he designed to have converted the small remains of his estate into ready money the next day, and to have left the kingdom by the first opportunity. His firmness on this occasion so effectually recommended him to Hampden, Pym, and the other leaders of the popular party, that they took him into all their councils; and here he acquired that clear insight into things, and that knowledge of men, of which he afterwards made such prodigious use. His exploits during the civil war, his murder of the king, and usurpation of the kingdom, are related under the article *BRITAIN*, n° 139.—188.

With regard to the character of Cromwell, Mr Hume expresses himself as follows: "The writers attached to this wonderful person make his character, with regard to abilities, bear the air of the most extravagant panegyric: his enemies form such a representation of his moral qualities as resembles the most virulent invective. Both of them, it must be confessed, are supported by such striking circumstances in his fortune and conduct, as bestow on their representation a great air of probability. 'What can be more extraordinary, it is said, than that a person of private birth and education, no fortune, no eminent qualities of body, which have sometimes, nor shining qualities of mind, which have often raised men to the highest dignities, should have the courage to attempt, and the abilities to execute, so great a design as the subverting one of the most ancient as well as best established monarchies in the world? That he should have the power and boldness to put his prince and master to an open and infamous death? Should banish that numerous and strongly allied family? Cover all these temerities under a seeming obedience to a parliament, in whose service he pretended to be retained? Trample too upon that parliament in their turn, and scornfully expel them as soon as they gave him ground of dissatisfaction? Erect in their place the dominion of the faints, and give reality to the most visionary idea which the heated imagination of any fanatic was ever able to entertain? Suppress again that monster in its infancy, and openly set himself up above all things that ever were called *sovereign* in England? Overcome first all his enemies by arms, and all his friends afterwards by artifice? Serve all parties patiently for a while, and afterwards command them victoriously at last? Over-run each corner of the three nations, and subdue with equal facility both the riches of the south, and the poverty of the north? Be feared and courted by all princes, and adopted a brother to the gods of the earth? Call together parliaments with a

word of his pen, and scatter them again by the breath of his mouth? Reduce to subjection a warlike and discontented nation by means of a mutinous army? Command a mutinous army by means of feditious and faction officers? Be humbly and daily petitioned, that he would be pleased, at the rate of millions a year, to be hired as master of those who had formerly hired him for their servant? Have the estates and lives of three nations as much at his disposal as was once the little inheritance of his father, and be as noble and liberal in the spending of them? And lastly, (for there is no end of enumerating every particular of his glory), with one word bequeath all this power and splendor to his posterity? Die possessed of peace at home, and triumph abroad? Be buried among kings, and with more than regal solemnity? And leave a name behind him not to be extinguished but with the whole world; which, as it was too little for his praise, so it might have been for his conquests, if the short line of his mortal life could have stretched out to the extent of his immortal designs?"

"My intention is not to disfigure this picture drawn by so masterly a hand: I shall only endeavour to remove from it somewhat of the marvellous, a circumstance which, on all occasions, gives much ground for doubt and suspicion. It seems to me that the circumstance of Cromwell's life in which his abilities are principally discovered, is his rising, from a private station, in opposition to so many rivals, so much advanced before him, to a high command and authority in the army. His great courage, his signal military talents, his eminent dexterity and address, were all requisite for this important acquisition. Yet will not this promotion appear the effect of supernatural abilities, when we consider that Fairfax himself, a private gentleman, who had not the advantage of a seat in parliament, had, through the same steps, attained even to a superior rank, and, if endued with common capacity and penetration, had been able to retain it. To incite such an army to rebellion against the parliament, required no uncommon art or industry: to have kept them in obedience, had been the more difficult enterprize. When the breach was once formed between the military and civil powers, a supreme and absolute authority, from that moment, is devolved on the general; and if he is afterwards pleased to employ artifice or policy, it may be regarded on most occasions as great condescension, if not as superfluous caution. That Cromwell was ever able really to blind, or over-reach, either the king or the republicans, does not appear: as they possessed no means of resisting the force under his command, they were glad to temporize with him, and, by seeming to be deceived, to wait for an opportunity of freeing themselves from his dominion. If he seduced the military fanatics, it is to be considered, that their interest and his evidently concurred; that their ignorance and low education exposed them to the grossest imposition; and that he himself was at bottom as frangible an enthusiast as the worst of them, and, in order to obtain their confidence, needed but to display those vulgar and ridiculous habits which he had early acquired, and on which he set so high a value. An army is so forcible, and at the same time so coarse a weapon,

that

Britain,
n° 107.

Cromwell. that any hand which yields it, may, without much dexterity, perform any operation, and attain any ascendancy in human society.

"The domestic administration of Cromwell, though it discovers great ability, was conducted without any plan either of liberty or arbitrary power: perhaps his peculiar situation admitted of neither. His foreign enterprises, though full of intrepidity, were pernicious to national interest; and seem more the result of impetuous fury or narrow prejudices, than of cool foresight and deliberation. An eminent personage, however, he was in many respects, and even a superior genius; but unequal and irregular in his operations: and, though not defective in any talent except that of elocution, the abilities which in him were most admirable, and which contributed most to his marvellous success, were the magnanimous resolution of his enterprises, and his peculiar dexterity in discovering the characters and practising on the weaknesses of mankind.

"If we survey the moral character of Cromwell, with that indulgence which is due to the blindness and infirmities of the human species, we shall not be inclined to load his memory with such violent reproaches as those which his enemies usually throw upon it. Amidst the passions and prejudices of that time, that he should prefer the parliamentary to the royal cause, will not appear extraordinary; since, even at present, many men of sense and knowledge are disposed to think, that the question, with regard to the justice of the quarrel, may be regarded as doubtful and ambiguous. The murder of the king, the most atrocious of all his actions, was to him covered under a mighty cloud of republican and fanatical illusions; and it is not impossible but he might believe it, as many others did, the most meritorious action which he could perform. His subsequent usurpation was the effect of necessity, as well as of ambition; nor is it easy to see how the various factions could at that time have been restrained without a mixture of military and arbitrary authority. The private deportment of Cromwell as a son, a husband, a father, a friend, is exposed to no considerable censure, if it does not rather merit praise. And, upon the whole, his character does not appear more extraordinary and unusual by the mixture of so much absurdity with so much penetration, than by his tempering such violent ambition and such enraged fanaticism with so much regard to justice and humanity."

That Cromwell continued a most complete and bigotted enthusiast to the very last, appears from his behaviour in his last sickness. His disease, which at first was a kind of slow fever, brought on by the cares and anxiety of his mind, soon degenerated into a tertian ague. For about a week the disorder continued without any dangerous symptoms, inasmuch that every other day he walked abroad; but one day after dinner his five physicians coming to wait upon him, one of them having felt his pulse, said that it intermitted. At this Cromwell was surprized, turned pale, fell into a cold sweat, and, when he was almost fainting, ordered himself to be carried to bed; where, by the assistance of cordials, being brought a little to himself, he made his will with respect to his private affairs. The next morning when one of his physicians came to visit

Cromwell. him, Cromwell asked him, why he looked so sad? and when answer was made, that so it became every one who had the weighty charge of his life and health upon him, "Ye physicians (says Cromwell), think I shall die: I tell you I shall not die this bout, I am sure of it. Do not you think, (said he to the physician, looking more attentively at him), do not think that I am mad: I speak the words of truth upon surer grounds than your Hippocrates or Galen can furnish you with. God Almighty himself hath given that answer, not to my prayers alone, but also to the prayers of those who entertain a stricter commerce and greater interest with him. Go on cheerfully, banishing all sadness from your looks; and deal with me as you would do with a serving man. Ye may have a skill in the nature of things; yet nature can do more than all physicians put together, and God is far more above nature." As this physician was coming out of the chamber, he accidentally met with another, to whom he expressed his fear that the protector was turning light-headed. But the other informed him that the chaplains, being dispersed the preceding night into different parts of the house, had prayed for the protector's recovery, and unanimously received for answer that he should recover. Nay, to such a degree of madness did they at last arrive, that, a public fast being kept at Hampton-court, they did not so much pray to God for the protector's health, as return thanks for the undoubted pledges they had of his recovery. On this account, though the physicians perceived his distemper increasing every hour, they took no notice of his danger, till it became necessary for him to appoint a successor while he had any breath remaining. But being then in a lethargic fit, he answered from the purpose; upon which he was again asked whether he did not name his eldest son Richard? and to this question he answered, Yes. Being then asked where his will was which he had formerly made concerning the heirs of the kingdom; he sent to look for it in his closet and other places, but in vain; for somebody had either stole it, or he himself had burnt it. Soon after, he expired, on the 3^d of September 1658, aged somewhat more than 59 years and four months. This day of September he had always reckoned to be the most fortunate for him in the whole year. A violent tempest, which immediately succeeded his death, served as a subject of discourse to the vulgar. His partizans, as well as his opponents, were fond of remarking this event; and each of them endeavoured, by forced inferences, to interpret it as best suited their particular prejudices.

It has been imagined by some, that Oliver Cromwell was poisoned; but for this there seems to be no reasonable foundation. His body was opened by Dr Bates. He found the brain somewhat overcharged with blood, and the lungs a little inflamed; but what he reckoned to have been the principal cause of his disorder was a total degeneracy of the substance of the spleen into a matter resembling the lees of oil. This, he thought, also accounted for the hypochondriac dispositions to which Cromwell had from his infancy been subject. Though the bowels were taken out, and the body filled with spices, wrapped in a fourfold cere-cloth, put first into a coffin of lead, and then into one of wood, yet the corruption was so great that the

humour

Cromwell
i
Cronen-
burg.

humour wrought itself through the whole, and there was a necessity of interring the body before the solemnity of the funeral. A very pompous funeral was ordered at the public expence, and performed from Somerset-house, with a splendour not only equal but superior to that bestowed upon crowned heads. Some have related that his body was deposited in Naseby field; others, that it was wrapped in lead, and sunk in the deepest part of the Thames, to prevent any insult that might afterwards be offered to it. But it seems beyond doubt that his body was interred at Westminster, as we are informed, that on the order to disinter him after the restoration, his corpse was found in a vault in the middle aisle of Henry VIIIth's chapel. In the inside of the coffin, and on the breast of the corpse was laid a copper plate finely gilt, inclosed in a thin case of lead: on one side of this plate were engraven the arms of England impaled with those of Oliver; and, on the reverse, the following legend: "*Oliverius Protector Reipublice Angliae, Scotiae, et Hiberniae, natus 25 Aprilis 1599, inauguratus 16 Decembris 1653, mortuus 3 Septembris anni. 1658, hic situs est.*"

Cromwell was of a robust frame of body, and of a manly, though not agreeable aspect. His nose being remarkably red and thinning, was often made the subject of ridicule. He left only two sons, Richard and Henry: and three daughters; one married to general Fleetwood, another to lord Fauconberg, and a third to lord Rich. His mother lived till after he was protector; and contrary to her orders he buried her with great pomp in Westminster Abbey. She could not be persuaded that ever his power or his person was in safety. At every noise she heard she would exclaim that her son was murdered; and was never satisfied that he was alive, if he did not receive frequent visits from him. She was a decent woman; and by her frugality and industry had raised and educated a numerous family upon a small fortune. She had even been obliged to set up a brewery at Huntingdon, which she managed to good advantage. Hence Cromwell, in the invectives of that age, is often stigmatized with the name of brewer. Ludlow, by way of insult, mentions the great accession which he would receive to his royal revenues upon his mother's death, who possessed a jointure of 60 pounds a year upon his estate. She was of a good family, of the name of Stuart; and is by some supposed to have been remotely allied to the royal family.

CROMWELL (Richard), eldest son of Oliver Cromwell, was by his father appointed successor to the protectorship, but very soon deposed by the army*. They discharged his debts, took all the household stuff, plate, &c. gave him a protection for six months, and so he retired. He was by no means qualified to support the station gained by the aspiring talents of his father; he was of a moderate temper, and untainted with that fanatical spirit which his father had so successfully cultivated: on the restoration he went abroad; but returned 1680 under the assumed name of Clark, and settled at Cheshunt in Hertfordshire, where he lived privately, and died in 1712, aged 86.

CRONENBURG, a town of Germany, in the circle of the upper Rhine, and in the landgrate of Hesse Cassel, with a strong castle. It is seated at the foot of

a high mountain, on a fertile soil, and is surrounded with a double wall. E. Long. 8. 15. N. Lat. 50. 15.

CRONENBURG, a strong fortress of Denmark, in the isle of Zealand, at the entrance of the sound, where the Danes take toll of such ships as are bound for the Baltic. It was very richly furnished, but pillaged by the Swedes in 1658, who took away the furniture, among which were some statues of massy silver. It is built upon piles. E. Long. 12. 50. N. Lat. 56. 0.

CRONSLOT, a town and fortress of Russia, in a little island of the same name, situated in the mouth of the river Neva, near the entrance of the gulph of Finland. It has a good harbour, which is the station of the Russian fleet, and where the great magazines of naval stores as well as docks and yards for building ships are. E. Long. 32. 0. N. Lat. 60.

CRONSTAT, a town of Transylvania, near the frontiers of Moldavia, subject to the house of Austria. E. Long. 25. 0. N. Lat. 47. 0.

CROP, the highest part or end of any thing cut off. It is particularly used for the corn gathered off a field in harvest. See AGRICULTURE, Part II. Sect. ii. v. vi.

CROSIER, or CROZIER, a shepherd's crook; a symbol of pastoral authority, consisting of a gold or silver staff, crooked at the top, carried occasionally before bishops and abbots, and held in the hand when they give the solemn benedictions. The custom of bearing a pastoral staff before bishops is very ancient. Regular abbots are allowed to officiate with a mitre and crozier. Among the Greeks none but a patriarch had a right to the crozier.

CROSIER, in astronomy, four stars in the southern hemisphere, in the form of a cross, serving those who sail in fourth latitudes to find the antarctic pole.

CROSLET, in heraldry, is when a cross is crossed again at a small distance from each of the ends. Up-ton says it is not so often borne by itself in arms, as other crosses are, but often in diminutives, that is, in small crosses scattered about the field. See HERALDRY, n^o 26. examp. 10.

CROSS, in antiquity, a species of punishment, or rather the instrument wherewith it was inflicted, consisting of two pieces of wood crossing each other.

This punishment was only inflicted on malefactors and slaves, and thence called *servile supplicium*. The most usual method was to nail the criminal's hands and feet to this machine, in an erect posture; though there are instances of criminals so nailed with their head downwards.

Invention of the Cross, a festival observed on May 3^d, by the Latin church, in memory of the empress Helena's (the mother of Constantine) finding the true cross of Christ on mount Calvary, where he caused erect a church for the preservation of it.

Exaltation of the Cross, a grand festival solemnized on September 14th in commemoration of Heraclius's restoring to mount Calvary the true cross, that had been carried off by Cosroes king of Persia, upon taking the city of Jerusalem.

Order of the Cross, an order of ladies instituted in 1668, by the empress Eleonora de Gonzaga, wife of the emperor Leopold, on occasion of the miraculous recovery of a little golden cross, wherein were in-

Crofs.

fed two pieces of the true crofs, out of the afhes of a part of the palace that had been burnt down; though the fire burnt the cafe wherein it was inclofed, and melted the cryftal, it appeared that the wood had not received the leaft damage.

CROSS, in heraldry. See HERALDRY, n^o 25.

The crofs is a very ancient and honourable bearing; and is frequently to be met with in the coats of arms of thofe whole ancftors attended the warlike expeditions againft the Turks.

CROSS, in mining, two nicks cut on the fuperficies of the earth, thus , which the miners make when they take the ground to dig for ore. This crofs gives the miners three days liberty to make and to fet on ftones. As many of thefe croffes as the miner makes, fo many mears of ground he may have in the vein, provided he fet on ftones within three days after making his crofs or croffes. But if he make but one crofs, and a ftander-by makes the fecond, and a ftanger makes the third, every one is ferved with the next mear, according as they have firft or laft, fooner or later made their crofs, or croffes upon the ground.

CROSS, in coins, a name given to the right fide, or face; the other being called the *pile* or *reverse*. It has been a common error, that the reverse was meant by the crofs; becaufe at this time, with us, it is marked with figures difpofed in that form: but the ftamping the head of the prince in thefe kingdoms, on the right fide of the coin, was preceded by a general cuftom of ftriking on that part the figure of a crofs, while the other, called the *pile*, contained the arms, or fome other device.

CROSS-Bar Shot, a bullet with an iron bar paffing through it, and ftanding fix or eight inches out at both fides: it is ufed at fea, for deftroying the enemy's rigging.

CROSS-Jack, pronounced *cro-jack*, a fail extended on the lower yard of the mizen maff, which is hence called the *crofs-jack yard*. This fail, however, has generally been found of little fervice, and is therefore very feldom ufed.

CROSS-Piece, a rail of timber extended over the *windlafs* of a merchant-ship from the knight-heads to the beftrey. It is ftuck full of wooden pins, which are ufed to fatten the running rigging as occafion requires. See WINDLASS.

CROSS Trees, certain pieces of timber, fupported by the *cheeks* and *trelle-trees*, at the upper ends of the lower maffs, athwart which they are laid to fufftain the frame of the *top*.

CROSS-Bill, in ornithology. See LOXIA.

CROSS-Wort, in botany. See VALENTIA.

CROSS, an English artift, famous only for copying, in the reigns of Charles I. and Charles II. Of this talent there is a ftory current, more to the credit of his skill than of his probity. He is faid to have been employed by Charles I. to copy the celebrated Madona of Raphael in St Mark's church at Venice; and that, having obtained leave of the ftate for that purpofe, he executed his piece fo well as to bring away the original and leave his copy in the place of it. The deception was not detected until it was too late to recover the lofs; and this piece was bought in Oliver's time

by the Spanifh ambaffador for his mafter, who placed it in the efcorial.

CROSSEN, a handfome town of Silefia in Germany, and capital of a principality of the fame name. It is fituated at the confluence of the rivers Bobar and Oder, in a fertile country abounding in wine and fruits. There is a bridge over the Oder which is fortified. E. Long. 15. 20. N. Lat. 52. 5.

CROTALARIA, RATTLE-WORT; a genus of the decandria order, belonging to the diadelphica clafs of plants. There are 11 fpecies, all of them natives of warm climates. They rife from 18 inches to 5 feet in height, and are adorned with flowers of a blue or yellow colour. The moft remarkable fpecies is the *retufa* with fimple oblong wedged leaves. It is a native of the ifland of Ceylon, and fome other parts of the Eaft Indies. The flowers are yellow, the pods fmooth, cylindrical, inflated, and placed horizontally: they are filled with feeds, which, when dried, and fhaken by the lighteft wind, emit a rattling noife: and this, by the rude inhabitants of the countries where the plant is native, is attributed to the devil, who is thought to deliver his oracles in this whimfical manner.

CROTALUS, or RATTLE-SNAKE, in zoology, a genus belonging to the order of amphibia serpentes; the characters of which are thefe: The belly is furnifhed with fcuta, and the tail has both fcuta and fcales; but the principal characteristic of this genus, is the rattle at the end of the tail. The rattles confift of feveral articulated cruftaceous, or rather horny, bags, which make a confiderable rattling noife when the creature moves, and ferves to warn people of their approach. There are five fpecies; and the bite of every one of them is fo highly poisonous, that it generally kills in a fhort time. Of thefe we have no account that can be depended upon, except that given by Mr Catefby of the horridus, or American rattle-fnake. This grows fometimes to the length of 8 feet, and weighs between 8 and 9 pounds. The colour of the head is brown; the eye red; the upper part of the body of a yellowifh-brown colour, tranfverfely marked with irregular broad black lifts. The rattle is of a brown colour, compofed of feveral horny, membranous, cells, of an undulated pyramidal figure. Thefe are articulated within one another in fuch a manner that the point of the firft cell reaches as far as the bafis of the protuberant ring of the third, and fo on; which articulation, being very loofe, gives liberty to the parts of the cells that are inclofed within the outward rings to ftrike againft the fides of them, and fo to caufe the rattling noife which is heard when the fnake fhakes its tail. This is the moft inactive and flow moving of all the fnakes, and is never the aggreffor except in what it preys upon. The above gentleman is of opinion that no remedy is yet difcovered for the bite of this animal. He had frequently accels to fee Indians bit by it, and always thought that thofe who recovered were cured more through the force of nature, or by reafon of the lightnefs of the bite, than by the remedies ufed. He tells us, that the Indians know their deftiny the moment they are bit; and if the bite happens to be on any of the large veins, they apply no remedies, as knowing them to be entirely ufelefs.

lefs. He believes the reports of the fascinating power of this serpent, though he never had an opportunity of seeing it. See Plate LXXXIV. fig. 10.

CROCHET, in music, one of the notes or characters of time, marked thus ♩ , equal to half a minim, and double of a quaver.

CROCHETS are also marks or characters, serving to inclose a word or sentence which is distinguished from the rest, being generally in this form [].

CROTON, **WILD RIGINS**; a genus of the polyandria order, belonging to the monœcia class of plants. There are 21 species; the only remarkable one of which is the tinctorium, or plant from which the French turnsole is made. This grows naturally in the south of France: it is an annual plant, rising about 9 inches high, with an herbaceous branching stalk, garnished with irregular or rhomboidal figured leaves, which are near two inches long, and an inch and a quarter wide in their widest part. These stand upon slender foot-stalks near four inches long. The flowers are produced in short spikes from the sides of the stalks, at the end of the branches; the upper part of the spike is composed of male flowers, having many stamina which coalesce at the bottom; the lower part hath female flowers, which have each a roundish, three-cornered, germen; these afterwards become a roundish capsule with three lobes, having three cells, each including one roundish seed. This flowers in July; but unless the plants are brought forward on a hot-bed, they do not ripen seeds in this country. The seeds of this plant should be sown in the autumn soon after they are ripe, in a small pot filled with light earth, and plunged into an old tan-bed in a frame, where they may be screened from cold in the winter; and in the spring following the pot should be removed to a fresh hot-bed, where the plants will come up in a month's time. When they are grown large enough to be removed, they are then to be planted each in a small pot, and plunged into a fresh hot-bed, being careful to shade the glasses daily, until the plants have taken new root: then they should have air daily admitted according to the warmth of the season, and but little water given them. By this method only they can be brought to flower well, and produce good seeds in this country.

From this plant is made the turnsole used for colouring wines and jellies. It is made of the juice which is lodged between the empalement and the seeds; which, if rubbed on cloths, at first appears of a lively green, but afterwards changes to a bluish purple colour. If these cloths are put into water, and afterwards wrung, they will dye the water to a claret colour. The rags thus dyed are brought to this country, and sold in the druggists's shops under the name of *turnsole*.

The other species of croton are natives of warmer climates. From one of them, called the *physic-nut tree*, is obtained a milky juice, said to be applied to green wounds with success. The nut, when ripe, yields a considerable quantity of oil, a spoonful of which swallowed when fresh is of a purgative quality, and is proper for abating dropical swellings.

CROTONA, a town of Italy, in the kingdom of Naples, seated on the gulph of Taranto, with a bishop's

see and a citadel. E. Long. 17. 27. N. Lat. 39. 10.

CROTOY, a town of France, in Picardy, and in Ponthieu. The fortifications are demolished. It is seated at the mouth of the river Somme. E. Long. 1. 45. N. Lat. 50. 15.

CROUCHED FRIARS. See **CROISIERS**.

CROUP, in medicine. See (the *Index* subjoined to) that article.

CROUP of a *Horse*, in the menage, the extremity of the reins above the hips.

CROUPADE, in the menage, a leap, in which the horse pulls up his hind legs, as if he drew them up to his belly.

CROUZAS (John Peter de), a learned philosopher and mathematician, was born in 1663: having made great progress in the mathematics and the philosophy of Des Cartes, he travelled to Geneva, Holland, and France; was successively professor in several universities; and at length was chosen governor to prince Frederic of Hesse-Cassel, nephew to the king of Sweden. He wrote many works, the most esteemed of which are, 1. His *Logic*, the best edition of which is that of 1741, in 6 vols 8vo; 2. A *Treatise on Beauty*; 3. A *Treatise on the Education of Children*, 2 vols 12mo; 4. Several *Treatises on Philosophical and Mathematical Subjects*, &c. He died at Lausanne in 1748.

CROW, in ornithology. See **CORVUS**.

Crow, in mechanics, a kind of iron lever, with a claw at one end, and a sharp point at the other; used for heaving or purchasing great weights.

Crow's Bill, among surgeons, a kind of forceps, for drawing bullets and other foreign bodies out of wounds.

Crow's Feet, in the military art, machines of iron, having four points, each about three or four inches long, so made, that whatever way they fall, there is still a point up: they are thrown upon breaches, or in passes where the enemy's cavalry are to march, proving very troublesome, by running into the horse's feet and laming them.

Crow-Foot, on ship-board, a complication of small cords spreading out from a long block, like the smaller parts which extend from the back-bone of a herring, (Plate LXXXII. fig. 12). It is used to suspend the *ownings*; or to keep the top-fails from striking violently, and fretting against the tops.

Crow-Net, is an invention for catching wild-fowl in the winter season, and may be used in the day-time. This net is made of double thread, or fine pack-thread; the meshes should be two inches wide, the length about ten yards, and the depth three; it must be verged on the side with good strong cord, and stretched out very stiff on long poles prepared for that purpose. When you are come to the place where you would spread your net, open it, and lay it out at its full length and breadth; then fasten the lower end of the net all along the ground, so as only to move it up and down; the upper end of the net must stand extended on the long cord; the further end thereof being staked first to the earth by a strong cord about five yards distant from the net. Place this cord in an even line with the lower edge of the net. The other end must be at least 25 yards distant to reach into some natural or artificial

artificial shelter, by the means of which you may lie concealed from the fowl, otherwise no good success can be expected. The net must be placed in such exact order that it may give way to play on the fowl on the least pull of the cord, which must be done smartly, lest the fowl should prove too quick for you. This net may be used for pigeons, crows, or other birds on corn-fields newly sown; as also in stubble-fields, provided the stubble conceals the net from the birds.

CROWD, in a general sense, signifies a number of people assembled in a place scarce big enough to hold them all.

To CROWD, in the sea-language, is to carry an extraordinary force of sail upon a ship, in order to accelerate her course on some important occasion; as in pursuit of, or flight from, an enemy; to escape any immediate danger, &c.

CROWLAND, a town in Lincolnshire, seated in the Fens, in a dirty soil, and had formerly an abbey of very great note. There is no coming at it but by narrow causeways, which will not admit a cart. It has three streets, separated from each other by water-courses, whose banks are supported by piles, and set with willow trees. Their chief trade is in fish and fowl, which are in great plenty in the adjacent pools and marshes. W. Long. 0. 10. N. Lat. 52. 40.

CROWN, an ornament worn on the head by kings, sovereign princes, and noblemen, as a mark of their dignity.

In scripture there is frequent mention of crowns, and the use of them seems to have been very common among the Hebrews. The high priest wore a crown, which was a fillet of gold placed upon the forehead, and tied with a ribbon of hyacinth colour, or azure blue. It seems also as if private priests, and even common Israelites, wore also a sort of crown, since God commands Ezekiel not to take off his crown, nor assume the marks of one in mourning. This crown was no more than a ribbon or fillet, with which the Jews and several people in the east girt their heads. And indeed the first crowns were no more than a bandelet drawn round the head, and tied behind, as we still see it represented on medals round the heads of Jupiter, the Ptolemies, and kings of Syria. Afterwards they consisted of two bandelets; by degrees they took branches of trees of divers kinds; at length they added flowers, inasmuch that Claudius Saturninus says, there was not any plant whereof crowns had not been made. The woods and groves were searched to find different crowns for the several deities; and they were used not only on the statues and images of the gods, by the priests in sacrificing, and by kings and emperors, but also on altars, temples, doors of houses, sacred vessels, victims, ships, &c.

The Roman emperors had four kinds of crowns, still seen on medals, viz. a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious stones, and the fourth a kind of bonnet or cap, something like the mortar.

The Romans had also various kinds of crowns, which they distributed as rewards of military achievements; as, 1. The oval crown, made of myrtle, and bestowed upon generals, who were intitled to the ho-

nours of the lesser triumph, called *ovation*. 2. The naval or rostral crown, composed of a circle of gold, with ornaments representing beaks of ships, and given to the captain who first grappled, or the soldier who first boarded an enemy's ship. 3. The crown called in Latin *vallis*, or *castrensis*, a circle of gold raised with jewels or palisades; the reward of him who first forced the enemy's entrenchments. 4. The mural crown, a circle of gold indented and embattled; given to him who first mounted the wall of a besieged place, and there lodged a standard. 5. The civic crown, made of the branch of a green oak, and given him who had saved the life of a citizen. 6. The triumphal crown, consisting at first of wreaths of laurel, but afterwards made of gold; proper to such generals as had the honour of a triumph. 7. The crown called *obdionalis*, or *graminea*, made of grass growing on the place; the reward of a general who had delivered a Roman army from a siege. 8. The racial crown, given to princes at their translation among the gods. We meet also with the corona aures, often bestowed on soldiers, without any other additional term; athletic crowns, and crowns of laurel, destined to crown victims at the public games, poets, orators, &c. All these crowns were marks of nobility to the wearers; and upon competitions with rivals for rank and dignities, often determined the preference in their favour. See Plate LXXXII. fig. 15, 16, 17, 18, 19, 20, 21, 22. For an account of modern crowns, see HERALDRY, n^o 42.

CROWN is also used to signify the possessions and dignity of a king. The crown of England, according to Sir William Blackstone, is, by common law and constitutional custom, hereditary; and this in a manner peculiar to itself; but the right of inheritance may from time to time be changed or limited by act of parliament, under which limitations the crown still continues hereditary. See SUCCESSION.

Pleas of the CROWN. See PLEAS.

CROWN, in commerce, a general name for coins both foreign and domestic, which are of, or very near, the value of five shillings sterling.

CROWN-Office, an office belonging to the king's bench court, of which the king's coroner or attorney is commonly master. In this office, the attorney-general and clerk of the crown severally exhibit informations for crimes and misdemeanours at common law, as in the case of batteries, conspiracies, libelling, &c. on which the offender is liable to pay a fine to the king.

CROWN-Glass, denotes the finest sort of window-glass. See GLASS.

CROWN-Scabs, in farriery. See there, § xxxvi. 2. CROWN-Wheel of a Watch, the upper wheel next the balance which by its motion drives the balance, and in royal pendulums is called the *swing-wheel*.

CROWN Imperial, in botany. See FRITILLARIA.

CROWNE (John), a celebrated dramatic writer, born in Nova Scotia, where his father was a minister. Being impatient of the gloomy restraint of that country, he came to England, where he was reduced to enter into the service of an old lady; of which he was soon as weary as he had been of America. He then had recourse to his pen, which quickly procured

Cruxal
I
Crucifix.

him favour at court; but this kind of subsistence proving precarious, he ventured to solicit Charles II. for some establishment. Charles promised to provide for him, but infisted first on having another comedy; and suggested to him the plan of a Spanish play, from which Crowne produced the comedy of *Sir Courtly Nice*: but the sudden death of the king on the last day of the rehearsal, plunged him at once from his pleasing expectations into disappointment and distress, and left him no resource but his wits. He died some time about the year 1703; and left behind him 17 tragedies and comedies, some of which are acted with great success. His chief excellency lay in comedy; yet his tragedies are far from being contemptible. His plots are for the most part his own invention; his characters are in general strongly coloured and highly finished; and his dialogue lively and spirited, attentively diversified, and well adapted to the several speakers. So that on the whole he may assuredly be allowed to stand at least in the third rank of our dramatic writers.

CROXAL (Samuel), an ingenious English divine, who in his youth wrote the celebrated poem intitled *The Fair Circassian*. He had the livings of Hampton in Middlesex; and the united parishes of St Mary Somerset, and St Mary Mounthaw, in London; both which he held till his death in 1751. He published many other poems and translations, with an entire English edition of *Esop's Fables*. In consequence of his attachment to Whig principles, he enjoyed some other preferments, and was chaplain in ordinary to George II.

CROYDON, a Town in Surry, in England. Its situation is low, near the spring-head of the river Wandel, and it is in a manner surrounded with hills. It is pretty large, and is chiefly noted for being the seat of the archbishop of Canterbury. It has a large handsome church, an hospital, and a free school. W. Long. o. 5. N. Lat. 51. 22.

CRUCIAL INCISION, in surgery, an incision made in the form of a cross.

CRUCIANELLA, **PETTY MADDER**; a genus of the monogynia order, belonging to the tetrandria class of plants. There are five species, natives of the southern parts of Europe, but none of them possessed of any remarkable quality.

CRUCIBLE, a chemical vessel made of earth, and so tempered and backed as to endure the greatest fire. They are used to melt metals, and to flux minerals, ores, &c. See **CHEMISTRY**, n° 86.

CRUCIFIX, a cross upon which the body of Christ is fastened in effigy, used by the Roman catholics to excite in their minds a strong idea of our Saviour's passion.

They esteem it an essential circumstance of the religious worship performed at the altar; and on Good Friday they perform the ceremony of adoring it, which is done in these words, *O crux ave, spes unica*; "Hail, thou cross, our only hope." The officiating priest uncovers the crucifix, elevates it with both his hands, and says, *Eccæ lignum crucis*; "Behold the wood of the cross." The people answer, *in quo salus mundi p. pendit*; "on which the Saviour of the world suffered death." Then the whole congregation bow

with great reverence, and devoutly kiss the holy wood.

CRUCIFIXION, a capital punishment by nailing the criminal to a cross. See **CROSS**.

CRUCIFORM, in general, something disposed cross-ways; but more especially used by botanists, for flowers consisting of four petals disposed in the form of a cross.

CRUDE, an epithet given to something that has not passed the fire, or had a proper degree of coction.

CRUDITY, among physicians, is applied to undigested substances in the stomach; to humours in the body which are unconcocted, and not prepared for expulsion; and to the excrements.

CRUISE, in the sea language, signifies to sail back and fore within a certain space of the sea, as well to annoy the enemy, as to protect our own trading vessels.

CRUISERS, in the navy, are small men of war made use of to and fro in the channel, and elsewhere, to secure our merchant ships and vessels from the enemy's small frigates and privateers. They are generally such as sail well, and are commonly well manned: and indeed the safety of the trade in the channel, and up and down the soundings, and other places, absolutely requires the constant keeping out such ships at sea.

CRUMENTATA, among zoologists, animals furnished with a pouch, or bag, wherein to receive their young in time of danger; as the opossum. See **DELPHIS**.

CRUOR, sometimes signifies the blood in general; sometimes only the venous blood; and sometimes extravasated or coagulated blood; but is most frequently used for the red globules of the blood, in contradistinction to the limpid or serous part.

CRUPPER, in the menage, the buttocks of a horse, the rump; also a thong of leather put under a horse's tail, and drawn up by thongs to the buckle behind the saddle, so as to keep him from casting the saddle forwards on his neck.

CRURÆUS, or **CRUREUS**, *Musculus*, in anatomy, a fleshy mass, covering almost all the fore-side of the os femoris, between the two vasti, which likewise cover the edges of this muscle on each side. See **ANATOMY**, *Table of the Muscles*.

CRURAL, in anatomy, an epithet given to the artery which conveys the blood to the crura or legs, and to the vein by which this blood returns towards the heart. See **ANATOMY**, n° 387. g.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes.

CRUSADO, in commerce, a Portuguese coin, struck under Alphonfus V. about the year 1457, at the time when pope Calixtus sent thither the bull for a crusade against the infidels. This coin has a cross on one side, and the arms of Portugal on the other.

CRUSCA, an Italian term signifying bran, is in use amongst us to denote that celebrated academy called *della Crusca*, established at Florence for purifying and perfecting the Tuscan language. See **ACADEMY**, N° 10. The academy took its name from its office, and the end propoed by it; which is, to refine the language,

Crucifixion
I
Crusca.

Crusta
|
Cruth.

language, and as it were to separate the bran from it. Accordingly, its device is a sieve; and its motto, *Il piu bel fior ne coglie*; that is, "It gathers the finest flour thereof." In the hall or apartment where the academy meets, M. Monconis informs us, that every thing bears an allusion to the name and device: the seats are in the form of a baker's basket; their backs like a shovel for moving of corn; the cushions of grey fatten, in form of sacks or wallets; and the branches where the lights are placed resembling sacks. The vocabulary *Della Crusca* is an excellent Italian dictionary, compiled by this academy.

CRUSTA LACTEA, in medicine, the same with ACHOR.

CRUSTACEOUS, an appellation given to animals covered with shells made up of several pieces, in contradistinction to those consisting of a single piece.

CRUTH, or CROWTH, a kind of musical instrument formerly in use among the common people in Wales. It is of the fiducial kind, somewhat resembling a violin, 22 inches in length, and an inch and an half in thickness. It has six strings supported by a bridge, and is played on with a bow: the bridge differs from that of a violin, in that it is flat and not convex on the top; a circumstance from which it is to be inferred, that the strings are to be struck at the same time, so as to afford a succession of concords. The bridge is not placed at right angles with the sides of the instrument, but in an oblique direction; and, which is further to be remarked, one of the feet of the bridge goes through one of the found-holes, which are circular, and rests on the inside of the back; the other foot, which is proportionably shorter, resting on the belly before the other found-hole. Of the strings, the four first are conducted from the bridge down the finger-board, as in a common violin; but the fifth and sixth, which are about an inch longer than the others, leave the small end of the neck about an inch to the right. The whole six are wound up either by wooden pegs in the form of the letter T, or by iron pins, which are turned with a wrest like those of a harp or spinnet. Of the tuning, it is to be remarked, that the fifth and sixth strings are the unison and octave of G; the fourth and fifth, the same of C; and the second and first, the same of D; so that the second pair of strings are a fourth, and the third a fifth to the first.

Concerning the antiquity of this instrument, there is but little written evidence to carry it further back than the time of Leland; nevertheless the opinion of its high antiquity is so strong among the inhabitants of the country where it was used, as to afford a probable ground of conjecture, that the cruth might be the prototype of the whole fiducial species of musical instruments. Another evidence of its antiquity, but which tends also to prove that it was not peculiar to Wales, arises from a discovery lately made and communicated to the society of antiquarians, respecting the abbey-church of Melrose in Scotland, supposed to have been built about the time of Edward II. It seems that among the outside ornaments of that church there is the representation of a *cruth*, very little different from the description above given. The instrument is now diffused, in so much that Sir John Hawkins, from whom

we extract, tells us, that there is but one person in the whole principality of North Wales that can play upon it; and as he was at that time near 60 years of age, the succession of performers is probably near an end.

CRUX, or St CROIX, one of the Caribbee islands, situated about 60 miles south-east of Porto-Rico, and subject to France. W. Long. 64. o. N. Lat. 17. 30.

CRYMODES, among physicians, a kind of fever attended with a shivering cold, and inflammation of the internal parts of the body.

CRYPTOGAMIA, (from *κρυπτος*, occultus, "concealed," and *γαμος*, nuptia, "nuptials"), the 24th class in the Linnæan system, comprehending those plants whose fructification is concealed either through minuteness, or within the fruit. See BOTANY, p. 1293, 1299; and the Scheme, p. 1292.

CRYPTOGRAPHY, the art of writing in cipher, or with sympathetic ink. See CIPHER and INK.

CRYSTAL, the name of a very large class of fossils; hard, pellucid, and naturally colourless; of regularly angular figures, composed of simple, not filamentous plates; not flexible nor elastic, giving fire with steel; not fermenting in acid menstrua, and calcining in a strong fire.

The orders of pure crystal are three; the first is perfect columnar crystals, with double pyramids, composed of 18 planes, in an hexangular column, terminated by an hexangular pyramid at each end: the second order is that of perfect crystals, with double pyramids, without a column, composed either of 12 or of 16 planes, in two hexangular pyramids, joined closely base to base, without the intervention of any column: the third order is that of imperfect crystals, with single pyramids, composed either of 12 or 10 planes, in an hexangular or pentangular column, affixed irregularly at one end to some solid body, and terminated at the other by an hexangular or pentangular pyramid.

These are all the general forms into which crystal, when pure, is found concentered: but under these there are almost infinite varieties in the number of angles, and the length, thickness, and other accidents of the columns and pyramids.

When crystal is blended with metalline particles at the time of its formation, it assumes a variety of figures wholly different from these, constituting a fourth order, under the name of *metalline crystals*: when that metal is lead, the crystal assumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad base; when iron, the crystal is found concentered in rhomboidal figures: these crystals are very common about mines; but the common spars, which are liable to be influenced in the same manner by the metals, and to appear in the very same form, are to be carefully distinguished from them. There is one very easy test for this purpose, which is, that all spars are subject to be dissolved by aqua fortis, and effervesce violently only on its touching them: but it has no such effects on crystal.

The pebble-crystal is common enough in all parts of the world; but that which is formed of hexangular columns, affixed to a solid base at one end, and terminated by a hexangular column at the other, is infinitely

Crux
|
Crystal.

Crystal.

nately more so: this is what we call *sparg* or *rock crystal*, and is the species described by most authors under the name of *crystal of the shops*, or that kept for medicinal uses.

The origin and formation of crystals, as to the time and manner of them, deserve a very nice inquiry; since many of the more compound fossil bodies are formed chiefly either of crystal, or of spar, a body in many things resembling it. The original formation and coalescence of those bodies of which spar is the basis, we know may have been but of yesterday, since we have evident proofs that spar is concreting to this day, and that sparry bodies are forming every moment. This is evident from the sparry stalactites in the arches of modern buildings, particularly in one lately built as the new bridge at Westminster; the roofs of the arches of which were filled with these spars within a year after they were built. It is also demonstrable that the spars are not formed of matter exuding from the stone, since brick arches abound equally with them; and the brick vault which supports part of the grand terrace at London, was some time ago so full of them that there was not room to walk. These observations sufficiently demonstrate the growth of spar; but the vegetation of crystal remained dubious till Dr Hill shewed by some experiments that *crystal*, as well as spar, is dissolved in every kind of water, even such as appears to be most pure and clear. This is also probable from an observation of Neuman's, who tells us, that he has seen leaves, stalks of plants, hay, straw, hogs bristles, &c. inclosed in sprigs of crystal. From the regular forms in which these natural crystals are found, the regular arrangement of salts into different figures takes the name of *crystallization*, and both are probably owing to the same cause*. Henckel gives us a remarkable account of the formation of crystal out of human urine. He once filled a large round glass-vessel half way up with the recent urine of a young lad, and tying a bladder over the mouth of the vessel, set it in a stove for four years together, never stirring it during that whole time. At the end of this time he found a number of small white stones growing to the inside of the glass; they were of the size of an oat-seed, of a prismatic figure, and tolerably pellucid: they stuck so fast to the sides of the glass that they could not be washed off by the shaking about of the urine; and when taken out had no saline taste, and were not soluble even in hot water.

Among the largest and finest crystals we have any account of, were those found in the mountains of Grimsfule between immense strata of stone. They were all as pure and limpid as the clearest water, and the largest of them measured near three feet in length, and little less in circumference; its weight was 250 pounds. Others were of 130, 100, and so on, till they came to 10 pounds weight; but these were the smallest found in that place. Neuman, however, tells us of a piece mentioned in the Bresslaw collections, which weighed upwards of 400 weight. In the Imperial collection at Vienna, there is a pyramidal crystal vase two ells in height, cut wholly out of one piece. It is usual with the largest crystals of the German mountains to be full of cracks and flaws, and to

be so constructed internally as to shew all the prismatic colours; but the above mentioned ones were quite free from these blemishes, and resembled columns of the purest glass, only much clearer than any glass can be made. Crystal is also found in many parts of Britain and Ireland. About Bristol it is found of an amethystine tinge. In Silesia and Bohemia, in Germany, it is found stained with the colours of the ruby, sapphire, emerald, and topaz; in which case jewellers make great advantage of it, selling it under the name of *accidental sapphire*, &c.

Crystal is frequently cut; and lustres, vases, and toys, are made of it as of other beautiful stones. For this purpose it is to be chosen perfectly clear and transparent. It is to be tried by aqua fortis, or by drawing it along a pane of glass. The genuine crystal will not be affected by the acid, and will cut glass almost like a diamond. When any piece of workmanship of natural crystal is become foul and dark, the following method is to be used for recovering its brightness without hurting the polish. Mix together six parts of common water, and one part of brandy; boil these over a brisk fire, and let the crystal be kept in it, in a boiling state, a quarter of an hour; then take it out, and rub it carefully over with a brush dipped in the same liquor; after this it is to be wiped with a napkin, and by that means its surface will be perfectly cleaned, and rendered as bright as at first, without any injury to the points of the cutting, or the polish of the planes or facets, which would probably have happened had the cleaning been attempted by mere rubbing with a cloth.

Natural crystal may be reduced by calcination into a state proper for making glass with alkaline salts, and thus becomes a very valuable frit. The method of doing it is as follows: calcine natural crystal in a crucible; when it is red-hot throw it into cold water. Repeat this eight times, covering the crucible that no dust or ashes may get in among the crystal. Dry this calcined mass, and reduce it to an impalpable powder.

Colouring CRYSTAL, for the imitation of gems. See DOUBLET.

CRYSTAL is also used for a facitious body, cast in glass-houses, called *crystal-glass*; being, in fact, no more than glass carried, in the composition and manufacture, to a greater perfection than the common glass.

The best kind of glass-crystal is that called *Venice-crystal*, made at Moran near Venice. See GLASS.

Island CRYSTAL. See ISLAND CRYSTAL.

CRYSTAL Dew. See DEW.

Disdiaclastic CRYSTAL. See DISDIACLASTIC.

Rock-CRYSTAL. See ROCK-CRYSTAL.

CRYSTALLINE, in general, something composed of, or resembling, crystal. See CRYSTAL.

CRYSTALLINE *Heavens*, in ancient astronomy, two spheres, imagined between the primum mobile and the firmament, in the Ptolemaic system, which supposes the heavens solid, and only susceptible of a single motion. See ASTRONOMY, n° 72.

CRYSTALLINE *Humour*. See ANATOMY, n° 406. p.

CRYSTALLINE, or CRYSTALLINES, in medicine, are pustules filled with water, and so called on account of their transparency. They are one of the worst symptoms attendant on a gonorrhœa. They are

Crystal
Crystalline.

* See Crystallization.

are lodged on the prepuce, without pain; and though caused by coition, have nothing of infection attending them. The cause is supposed to be a contusion of the lymphatic vessels in the part affected. Dr Cockburn, who hath described this case, recommends for the cure a mixture of three parts of lime-water, and two of rectified spirit of wine, to be used warm, as a lotion, three times a-day.

CRYSTALLIZATION, in general, signifies the natural formation of any substance into a regular figure, resembling that of natural crystal. Hence the phrases of crystallized ores, crystallized salts, &c. and even the basaltic rocks are now generally reckoned to be effects of this operation. See BASALTES, and VOLCANO. The term, however, is most commonly applied to bodies of the saline kind, and their separation in regular figures from the water, or other fluid in which they were dissolved, is called their *crystallization* *. The word *crystallization* is never applied to the freezing of water, or to the consolidation of metals after they have been melted; though it might certainly be applied with as much justice to these substances as to any others; for all of them concrete into a certain regular form, from which they never deviate, unless disturbed. When water freezes slowly, it always forms regular crystals of ice, which are constantly of the same form. They are long, needle-like masses, flattened on one side, and joined together in such a manner, that the smaller are inserted into the sides of the greater; and thus these compound crystals have the appearance of feathers, or branches of trees with leaves. The most remarkable circumstance attending this crystallization is, that the angle formed by the insertion of the smaller pieces into the larger is either 60, or 120 degrees. The figures assumed by metals of different kinds have not been so exactly investigated, except in the regulus of antimony, which is observed always to take a stellated form. Experience also shews, that all kinds of earths, or other mineral matters, are capable of assuming a crystalline form, and may easily be made to do so by taking away part of the water which dissolves them.

Different salts assume different figures in crystallization, and are thus most easily distinguished from one another. The methods of reducing them into this form, for sale, are mentioned under the article CHEMISTRY, n° 74. But besides the large crystals produced in this way, each salt is capable of assuming a very different appearance of the crystalline kind, when only a single drop of the saline solution is made use of, and the crystallization viewed through a microscope. For our knowledge of this species of crystallization we are indebted to Mr Henry Baker, who was presented with a gold medal for the discovery, in the year 1744. These microscopical crystals he distinguishes from the large ones by the name of *configurations*; but this term seems inaccurate, and the distinction may well enough be preserved by calling the large ones the *common*, and the small ones the *microscopical* crystals of the salt. His method of making these observations he gives in the following words:

"I dissolve the subject, to be examined, in no larger a quantity of rain or river water than I am certain it is sufficient to saturate. If it is a body easily

dissolvable, I make use of cold water; or otherwise I make the water warm, hot, or even boiling, according as I find it necessary. After it is perfectly dissolved, I let it rest for some hours, till, if overcharged, the redundant saline particles may be precipitated, and settle to the bottom, or shoot into crystals; by which means I am most likely to have a solution of the same strength at one time as at another; that is, a solution fully charged with as much as it can hold up, and no more; and by these precautions the configurations appear alike, how often soever tried: whereas, if the water be less saturated, the proportions at different times will be subject to more uncertainty; and if it be examined before such separation and precipitation of the redundant salts, little more will be seen than a confused mass of crystals.

"The solution being thus prepared, I take up a drop of it with a goose quill cut in fashion of a scoop, and place it on a flat slip of glass of about three quarters of an inch in width, and between three and four inches long, spreading it on the glass with the quill, in either a round or an oval figure, till it appears a quarter of an inch, or more, in diameter, and so shallow as to rise very little above the surface of the glass. When it is so disposed, I hold it as level as I can over the clear part of a fire that is not too fierce, or over the flame of a candle, at a distance proportionable to the heat it requires, (which experience only can direct), and watch it very carefully till I discover the saline particles beginning to gather and look white, or of some other colour at the extremities of the edges. Then, (having adjusted the microscope before-hand for its reception, armed with the fourth glass, which is the fittest for most of those experiments), I place it under my eye, and bring it exactly to the focus of the magnifier; and, after running over the whole drop, I fix my attention on that side where I observe any increase or pushing forwards of crystalline matter from the circumference towards the centre.

"This motion is extremely slow at the beginning, unless the drop has been overheated, but quickens as the water evaporates; and, in many kinds, towards the conclusion, produces configurations with a swiftness inconceivable, composed of an infinity of parts, which are adjusted to each other with an elegance, regularity, and order, beyond what the exactest pencil in the world, guided by the ruler and compasses, can ever equal, or the most luxuriant imagination fancy.

"When this action once begins, the eye cannot be taken off, even for a moment, without losing something worth observation: for the figures alter every instant till the whole process is over; and, in many sorts, after all seems at an end, new forms arise, different entirely from any that appeared before, and which probably are owing to some small quantity of salt of another kind, which the other separates from, and leaves to act after itself has done: and in some subjects, three or four different sorts are observable, few or none of them being simple and homogeneous.

"When the configurations are fully formed, and all the water evaporated, most kinds of them are soon destroyed again by the moisture or action of the air upon them; their points and angles lose their sharpness,

* See Chemistry, n° 74.

**CrySTALLI-
tion.** nefs, become uneven and defaced, and moulder, as it were, away. But some few are permanent, and being inclosed between glasses, may be preserved months, or even years, entertaining objects for the microscope.

"It happens oftentimes that a drop of saline solution can hardly be spread on the slip of glass, by reason of the glass's smoothness, but breaks into little globules, as it would do if the surface were greasy; this was very troublesome, till I found a way of preventing it, by rubbing the broken drop with my finger over the glass, so as to leave the surface smeared with it; on which smeared place, when dry, another drop of the solution may be spread very easily in what form one pleases.

"It likewise sometimes happens, that when a heated drop is placed properly enough for examination, the observer finds he can distinguish nothing: which is owing to saline steams that rise from the drop, cover and obscure the object-glass, and therefore must immediately be wiped away with a soft cloth or leather.

"In all examinations by the microscope of saline solutions, even though made in the day-time, I always employ the light of a candle, and advise every observer to do so likewise: for the configurations being exceedingly transparent, are rendered much more distinguishable by the brown light a candle affords, than by the more white and transparent day-light; and besides, either by moving the candle or turning the microscope, such light may be varied or directed just as the object requires."

In this manner were produced the beautiful crystallizations represented Plate LXXXV. They are vastly different from such crystals of the same salts as are obtained by the common processes; but Mr Baker assures us they are no less constant and invariable than they, and that he has repeated the experiments a great number of times with the same success.

Fig. 1. shews the microscopical crystals of *nitre* or *salt-petre*. These shoot from the edges, with very little heat, into flattish figures of various lengths, exceedingly transparent, and with straight and parallel sides. They are shewn in their different degrees of progression at the letters *a, b, c, d, e*; where *a*, represents how they first begin. After numbers of these are formed, they will often dissolve under the eye, and disappear entirely; but if one waits a little, new shoots will push out, and the process go on afresh. These first figures sometimes enlarge only without altering their shapes, and sometimes form in such sort as the drop represents; but if the heat has been too great they shoot hastily into numerous ramifications very numerous and very beautiful, but very difficult to be drawn; and which Mr Baker therefore did not attempt. There seems all the while a violent agitation in the fluid, and most commonly, towards the conclusion, a few octaedra (composed of eight triangular planes, or two quadrangular pyramids, joined base to base), make their appearance.

2. *Blue vitriol*, produces crystals round the edges, very short at the beginning, but increasing gradually, as represented at the figures 1, 2, 3, which denote their difference of form, and the progress of their

growth. These crystalline shoots are solid, regular, transparent, and reflect the light very beautifully from their polished sides and angles. As the watery part evaporates, numbers of long slender bodies like hairs are seen here and there, some lying side by side, or crossing each other as at 4, others forming star-like figures with many radiations (5, 5). This salt shoots but slowly, and therefore requires patience. At last the true crystals begin to appear commonly in the middle of the drop, and are very prettily branched, as at 6.

3. *Distilled verdigrease*, dissolved as above directed, and immediately applied to the microscope, shews a abundance of the regular figures 1, 2, 3, 4, 5, 6, 7: but if the solution is suffered to stand for a few hours, and a drop of it is then heated over the fire on a slip of glass, till it begins to congregate about the sides, and then examined, sharp-pointed, solid, figures, bisected by a line cut through the middle, from which they are cut away towards the edges, begin to appear, and shooting forwards (1, 1, 1). These figures are often striated very prettily from the middle line to the edges obliquely, (2, 2); and frequently they arise in clusters; and shooting from a centre (3, 3). These figures are a long time in growing; and whilst they are doing so, several regular crystals appear forming in several parts of the drop, of the most lovely emerald colour, and reflecting the light from their sides and angles, which are most exactly disposed, and finely polished. No crystals are formed in the middle, till the water is nearly evaporated; and then they begin to form hastily, for which reason they must be carefully attended. Their common figure resembles two long *ss* crossing each other in an angle of about 60°, and shooting branches every way: each of which again protrudes other branches from one, and sometimes from both its sides; making together an appearance like four leaves of fern conjoined by their stalks (5, 5). Separate clusters of the same sharp pointed figures as those at the edges of the drop, are also formed in the middle of it (6). Sometimes also they put on another form, like the leaves of dandelion, (7). Very beautiful figures are likewise produced by a kind of combination of sharp points and branches, (8, 8). All these crystals are of a most beautiful green colour, but deeper or lighter, according to the time of their production. The deepest are constantly produced first, and the paler ones afterwards. Towards the end of the process some circular figures are formed, extremely thin, and so slightly tinged, with green lines radiating from a centre, as to be almost colourless (9, 9). When all seems in a manner over, bundles of hair-like bodies appear frequently scattered here and there throughout the drop, like those of blue vitriol already described.

4. *Alum*. The microscopical crystals of this salt prove more or less perfect according to the strength of the solution and the degree of heat employed in making the experiment. The solution of alum, however saturated with the salt, will not be found overstrong after standing some days; for in that time many crystals will have formed in it. This separation will often leave the remainder too weak for the purpose; but by holding the vial over, or near the fire, the crystals will again dissolve. After it has stood about half an hour, it may then be used. The drop, put on the

**CrySTALLI-
tion.**

crystallization.

the glass, and properly heated, exhibits commonly at first a dark cloud which appears in motion somewhere near the edge, and runs pretty swiftly both to the right and left, until it is either stopped by the intervention of regular crystals, or else it proceeds both ways at once, till having surrounded the whole drop, the two ends rush together, and join into one (*a, a*). This cloudy part, which seems to be violently agitated while it is running round, appears on a strict examination to consist of salts, shot into long and very slender lines, much finer than the smallest hair, crossing each other at right angles. As they go along, rows of solid crystals are produced from their internal edges. These are composed of many oblique plain sides, (*b, b*), and which have all a tendency towards the figures of the regular crystals to be described presently. But it frequently happens, that, in some parts of the drop, many minute and circular figures are seen, rising at some little distances from the edge, which enlarging themselves continually, appear at last of a star-like form (*c, c*). The crystals in the middle seldom appear till the fluid seems almost wholly evaporated; when, on a sudden, many straight lines appear pushing forwards, whose sides or edges are jagged, and from which other similar straight and jagged lines shoot out at right angles with the first. These again have other small ones of the same kind shooting out likewise from themselves, and compose altogether a most beautiful and elegant configuration (*D*). Each of these lines increasing in breadth towards its end, appears somewhat club-headed (*e, e, e*). Sometimes, instead of sending branches from their sides, many of these lines rise parallel to each other, resembling a kind of palisade, and having numberless minute transverse lines running between them (*F*). But the most wonderful part of all, though not producible without an exact degree of heat and right management, is the dark ground work (*G*). It consists of an infinity of parallel lines, having others crossing them at right angles, and producing a variety scarce conceivable from lines disposed in no other manner: the direction of the lines (which are exquisitely straight and delicate) being so frequently and differently changed, that one would think it the result of long study and contrivance. During the time this ground work is framing, certain lucid points present themselves to view most commonly on one side. These grow continually larger, with radiations from a centre, and become star-like figures as before-mentioned. Some of them send out long tails, which give them the appearance of comets: and at the end of all, a dark lineation in various directions darts frequently through, and occupies all, or most of the spaces between them, making thereby no ill representation, when viewed by candle-light, of a dark sky, illuminated with stars and comets. The regular crystals are often formed in the same drop with the others (*f*).

5. *Borax*. If a drop of solution of borax is held too long over the fire, it hardens on the slip of glass in such a manner that no crystals can appear. The best method is to give it a brisk heat for about a second, and then applying it to the microscope, the crystals will quickly form themselves as represented in the figure.

6. *Sal ammoniac* begins with shooting from the edges great numbers of sharp, but thick and broad spi-

culæ, from whose sides are protruded as they rise, Crystallization.
many others of the same shape, but very short; parallel to each other, but perpendicular to their main stem (*1*). These spiculæ arrange themselves in all directions; but for the most part obliquely to the plane from whence they rise, and many are frequently seen parallel to one another (*1, 1*). As they continue to push forwards, which they do without increasing much in breadth, some shoot from them the small spiculæ only (*2*); others divide in a singular manner by the splitting of the stem (*3*); and others branch out into smaller ramifications (*4*). Before the middle of the drop begins to shoot, several exceedingly minute bodies may be discerned at the bottom of the fluid. These, in a little while rise to the top, and soon distinguish their shape as at (*5*). Their growth is very quick, and for some time pretty equal; but at last some branch gets the better of the rest, and forms the figure (*6*). The other branches enlarge but little after this, all the attraction seeming to be lodged in that one that first began to lengthen; and from this, more branches being protruded, and they again protruding others, the whole appears as at (*8*). It is not uncommon to see in the middle of the drop, some crystals, where instead of the straight stems above described, there is formed a kind of zig-zag, with spiculæ like those in the other figures (*7*).

7. *Salt of Lead, or saccharum saturni*. A little of this salt dissolved in hot water, which it immediately renders milky, after standing a quarter of an hour to subside, is in a fit condition for an examination by the microscope. A drop of it then applied on a slip of glass and held over the fire to put the particles in action, will be seen forming round the edge a pretty even and regular border of a clear and transparent film or glewy substance (*a a a a*); which if too sudden and violent a heat be given, runs over the whole area of the drop, and hardens so on the glass as not to be got off without great difficulty. But if a moderate warmth be made use of, which likewise must not be too long continued, this border proceeds only a little way into the drop, with a kind of radiated figure composed of fine lines, or rather bundles of lines, beginning from the centres in the interior edge of the border, and spreading out at nearly equal distances from each other every way, towards the exterior (*b b b b*). From the same centres are produced afterwards a radiation inwards, composed of parallelograms of different lengths and breadths; from one, and sometimes both the angles of these, are frequently seen shootings so exceedingly slender, that they are perhaps the best possible representations of a mathematical line. The extremities of the parallelograms are generally cut off at right angles; but they are sometimes also seen oblique (*c c c c*). Centres with the like radii issuing from them, and some of the glutinous matter for their root, are sometimes formed in the drop, entirely detached from the edges; and in these it is very frequent to find a kind of secondary radii proceeding from some of the primary ones; and others from them again to a great number of gradations, forming thereby a very pretty figure (*D*).

8. *Salt of Tin*, produces at the edges of the drop a number of octædra, partly transparent, standing on long;

Crystallization. long necks, at small distances from each other, with angular shoots between them (*a a*). At the same time, solid and regular opaque cubes will be seen forming themselves in other parts of the drop, (*b b*). In the middle of the same drop, and in several other parts of it very different figures will also be formed; particularly great numbers of flat, thin, transparent, hexangular bodies (*c c c*); some among which are thicker (*e*), and a few appear more solid, and with six sloping sides rising to a point, as if cut and polished (*d*). The figure (*f*) is composed of two high pyramids united at their base. Some in this kind of form are found truncated at one of their ends, and others at both. Several of the hexagonal bodies may be observed with sloping sides, forming a smooth, triangular, rising plane, whose angles point to three intermediate sides of the hexagon (*g*).

9. *Epson Salt*, begins to shoot from the edge in jagged figures (*a*). From other parts differently figured crystals extend themselves towards the middle, some of which have fine lines proceeding from both sides of a main stem, in an oblique direction; those on one side shooting upwards in an angle of about 60°, and those on the other downwards in the same obliquity (*c, f*). Others produce jags from their sides nearly perpendicular to the main stem, thereby forming figures that resemble some species of the polipody (*e*); but in others the jags are shorter (*d*). Now and then one of the main stems continues shooting to a considerable length, without any branchings from the sides; but at last sends out two branches from its extremity (*g*). Sometimes a figure is produced having many fine and minute lines radiating from a centre (*b*). The last shootings in the middle of the drop (*h*) are not unlike the frame work for the flooring or roofing of a house, but with the angles oblique: and sometimes a form of another kind presents itself (*i*).

10. *Scarborough Salt*, begins to shoot from the edges: first of all in portions of quadrilateral figures, much resembling those of common salt; but two of their angles, instead of 90, are about 100°. They shoot in great numbers round the borders of the drop, having their sides as nearly parallel to one another as the figure of the drop will allow: some proceed but a little way, others farther, before they renew the shoot (*a a*). In some places they appear more pointed and longer (*b*); and sometimes, instead of the diagonal, one of the sides is seen towards the edge, and the other shooting into the middle (*c*). The middle crystals (*d, f*) seem to be of the vitriolic kind.

11. *Glauber's Salt*, produces ramifications from the side of the drop, like the growth of minute plants, but extremely transparent and elegant (*c*). Some of them, however, begin to shoot from a centre at some distance from the edge, and protrude branches from that centre in a contrary direction (*b*). Sometimes they shoot from one, and sometimes from more sides of the central point in different varieties (*d*). Other figures are produced from different parts of the edge of the drop (*a, f, e*); but the most remarkable and beautiful crystallization forms last of all near the middle of the drop. It is composed of a number of lines proceeding from one another at right angles with transparent spaces and divisions running between them, appearing

all together like streets, alleys, and squares, (*g g*). When this crystallization begins, it forms with great rapidity, affording the observer a very agreeable entertainment: but its beauty is of very short duration: in a few moments it dissolves and vanishes like melted ice, which renders the drawing of it very difficult.

12. *Salt of Jesuits bark*. The few shootings which this salt produces at the edge of the drop are of no regular figure (*a*). The whole area becomes quickly filled with great numbers of rhombi, of different sizes, extremely thin and transparent (*b*). Some of these enlarge greatly and acquire a considerable thickness, forming themselves into solids of many sides (*c c*). Near the conclusion some crystals of sea-salt are formed (*d d*), and likewise a few odd triangular figures (*e*).

13. *Salt of Liquorice*, begins shooting from the edge with a sort of rhombic spiculae (*a*). Some four branched figures like those of vitriol, commonly appear, but moulder away before their ramifications are completed, leaving only their stamina behind (*b b*). The middle of the drop is usually overlaid with great numbers of parallelograms, some exceedingly transparent, being mere planes; having sometimes one, sometimes more of the angles canted, in such a manner as to produce pentagonal, hexagonal, and other figures. Others have much thickness, and form parallelepipeds, prisms, (*c*). Some of the plane figures now and then protrude an irregular kind of shooting which appears very pretty (*d*).

14. *Salt of Wormwood*. The first shootings of this salt from the edges of the drop appear of a considerable thickness in proportion to their length: their sides are deeply and sharply jagged or indented, being made up of many somewhat obtuse angles, and their ends pointed with angles of the same kind (*a*). But other shoots frequently branch out from these original ones, and they again send forth others making all together a very pretty appearance (*b b*). The crystals of this salt are very different from each other, consisting of squares, rhombi, parallelograms, &c. (*c*).

15. *Salt of Tobacco*. If a moderate degree of heat is given to a solution of this salt, its first shootings will be from the edges of the drop, in slender tapering figures, ending with very sharp points, but at considerable distances from one another. Along with these, are formed other crystals nearly of the same kind, but entirely detached, and farther within the drop, having the thicker ends towards the centre of the drop, and the sharp points turned towards its edge (*a*). When a little more heat has been given, other spiculae are produced from the edge, whose ends spread on either side, and then terminate in a point: and which have all along their sides triangular pointed crystals placed alternately so as to represent a zig-zag, with a line drawn through its middle (*b*). The regular crystals are produced in the middle of the drop, and are either hexagons or rhombi (*c*). When the moisture is nearly exhaled there are sometimes seen to shoot from, or rather under the spiculae, upon the plane of the glass, a representation of leaves very small at their first appearance, but gradually increasing (*d*). A violent agitation may be discovered in the fluid by the first magnifier, during the whole process;

crystallization. but especially at the beginning, and extremely minute crystals rising from the bottom.

16. *Salt of Hartshorn*. On the application of a very small degree of heat, salt of hartshorn shoots near the edges of the drop into solid figures somewhat resembling razors or lancets, where the blade turns into the handle by a clasp (*d*). The crystals of this salt are produced with great velocity, and are somewhat opaque, shooting from the edges of the drop, on both sides a main stem, and with a kind of regularity, rugged branches like those of some sorts of coral (*a a*). But sometimes, instead of these branches, sharp spiculae, some plain, and others jagged, are protruded to a considerable depth on one side only (*b*). As the fluid exhales, some one of the branching figures generally extends to a great length, producing on one side shoots that are rugged and irregular, and, on the other, curious regular branches resembling those of some plant (*e*).

17. *Salt of Urine*, shoots from the edges of the drop in long parallelograms like nitre (*a a*). But in other places, along the sides of the drop solid angles are formed, that seem to be the rudiments of common salt (*b*). Some of the parallelograms increase much in size, and spread themselves in the middle, so as to change their first figure, and become three or four times bigger than the rest: and these have a dividing line that runs through their whole length from end to end, whence issue other short lines at small distances, opposite to one another; all pointing with the same degree of obliquity towards the base (*c c*). Among these enlarged figures, some few shoot still forward and tapering towards a point, but, before they form one, swell again, and begin as it were anew; and thus they proceed several times before their figure is quite finished (*d d*). The figures 1, 2, 3, 4, 5, 6, are the regular crystals of this salt when it is allowed to dissolve in the air, and no heat at all is given.

18. *Rheum*, or the clear liquor which distils from the nostrils when people catch cold, is strongly saturated with salt. A drop of it on a slip of glass will soon crystallize in a beautiful manner, either with, or without heat; but if heated to about the warmth of the blood, and then viewed through the microscope, many lucid points will be seen rising and increasing gradually, till their form is shewn to be quadrangular, with two transparent diagonals crossing each other (*d d*). These diagonals shoot soon after far beyond the square, protruding other lines at right angles from their sides; and thus they go on to form the most elegant and beautiful crystals. When a drop of rheum is set to crystallize without any heat, instead of branched crystals over the whole area, such are formed only in the middle; but, about the edges, plant-like figures are produced shooting several stems from one point, and resembling a kind of sea-moss (*E*).

19. *Cauphire*, though insoluble in water, dissolves very readily in spirit of wine. A drop of this solution spread upon a slip of glass crystallizes instantly in the beautiful manner represented in the figure.

20. *Manna* easily dissolves in water, and a drop of the solution is a very pretty object. Its first shootings are radiations from points at the very edge of the drop: the radiating lines seem opaque, but are very

slender (*a a a*). Amongst these arise many minute transparent columns, whose ends grow wider gradually as they extend in length, and terminate at last with some degree of obliquity (*b*). Some few figures radiating from a centre every way, and circumscribed by an outline, are produced within the drop (*d d*). But the most surprising and elegant configuration is composed of many clusters of radiations shooting one from another over great part of the drop, and making all together a figure not unlike a certain very beautiful sea-plant. The regular crystals are represented at (*e*).

The above are the most remarkable crystallizations described by Mr Baker. He endeavours in some measure to account for them; but neither he, nor any other person, hath as yet been able to say any thing satisfactory on the subject. It hath never been shewn with any degree of plausibility why salts should assume any regular figure at all; much less why every one should have a form peculiar to itself. Sir Isaac Newton endeavoured to account for this, by supposing the particles of salt to be diffused through the solvent fluid at equal distances from each other; and consequently he thought the power of attraction between the saline particles could not fail to bring them together in regular figures, as soon as the diminution of the heat suffered them to act upon each other. But it is certain that some other agent must be concerned in this operation than mere attraction, otherwise all salts would crystallize in the same manner. Others therefore have had recourse to some kind of polarity in the particles of each salt, which determined them to arrange themselves in such a certain form. But unless we give a reason for this *polarity*, we only explain crystallization by itself when we give that as the cause. One thing which seems to have been entirely overlooked by those who attempt to investigate this subject is, that the saline particles do not only attract one another, but also some part of the water which dissolves them. Did they only attract each other, the salt, instead of crystallizing, would fall to the bottom as a powder. But instead of this, a saline crystal is composed of salt and water as certainly as the body of an animal is composed of flesh and blood, or a vegetable, of solid matter and sap; if a saline crystal is deprived of its aqueous part, it will as certainly lose its crystalline form as if it was deprived of the saline part. The most probable conjecture therefore on this subject would seem to be, that crystallization is a species of vegetation, and is accomplished by the same powers to which the growth of plants and animals are to be ascribed. See *VEGETATION*.

CRYSTALS, in chemistry, salts or other matters shot, or congealed, in the manner of crystal. See *CHEMISTRY*, n° 74.; and *CRYSTALLIZATION*.

CTESIAS, a native of Cnidos, who accompanied Cyrus the son of Darius in his expedition against his brother Artaxerxes; by whom he was taken prisoner. But curing Artaxerxes of a wound he received in the battle, he became a great favourite at the court of Persia, where he continued practising physic for 17 years, and was employed in several negotiations. He wrote the *History of Persia* in 23 books, and a *History of the Indies*: but these works are now lost, and

all we have remaining of them is an abridgement compiled by Photius. The most judicious among the ancients looked upon Cæſias as a fabulous writer; yet several of the ancient historians and modern Christian writers have adopted in part his chronology of the Assyrian kings.

CÆſIPHON, a celebrated Greek architect, who gave the designs for the famous temple of Epheſus, and invented a machine for bringing thither the columns to be used in that noble structure. He flourished 544 B. C.

CUB, a bear's whelp. Among hunters, a fox and marten of the first year are also called *cubs*. See URUS.

CUBA, a large, and very important island in the West Indies, belonging to Spain. On the east-side it begins at 20. 20. N. Lat. touches the tropic of cancer on the north, and extends from 74. to 85. 15. W. Long. It lies 60 miles to the west of Hispaniola, 25 leagues north of Jamaica, 100 miles to the east of Jucatan, and as many to the south of Cape Florida; and commands the entrance of the gulphs both of Mexico and Florida, as also the windward passages. By this situation it may be called the *key* of the West Indies. It was discovered by Columbus in 1492, who gave it the name of Ferdinand, in honour of king Ferdinand of Spain; but it quickly after recovered its ancient name of *Cuba*. The natives did not regard Columbus with a very favourable eye at his landing, and the weather proving very tempestuous, he soon left this island, and sailed to *Hayti*, now called *Hispaniola*, where he was better received. The Spaniards, however, soon became masters of it. By the year 1511, it was totally conquered; and in that time they had destroyed, according to their own accounts, several millions of people. But the possession of Cuba was far from answering the expectations of the Spanish adventurers, whose insatiable avarice could be satisfied with nothing but gold. These monsters finding that there was gold upon the island, concluded that it must come from mines; and therefore tortured the few inhabitants they had left, in order to extort from them a discovery of the places where these mines lay. The miseries endured by these poor creatures were such that they almost unanimously resolved to put an end to their own lives, but were prevented by one of the Spanish tyrants called *Vasco Perellos*. This wretch threatened to hang himself along with them, that he might have the pleasure, as he said, of tormenting them in the next world worse than he had done in this; and so much were they afraid of the Spaniards, that this threat diverted these poor savages from their desperate resolution. In 1511, the town of Havannah was built, now the principal place on the island. The houses were at first built only of wood; and the town itself was for a long time so inconsiderable, that in 1536 it was taken by a French pirate, who obliged the inhabitants to pay 700 ducats to save it from being burnt. The very day after the pirate's departure, three Spanish ships arrived from Mexico, and having unloaded their cargoes, failed in pursuit of the pirate ship. But such was the cowardice of the officers, that the pirate took all the three ships, and returning to the Havannah, obliged the inhabitants to pay 700 ducats more. To prevent mis-

Cuba.

fortunes of this kind the inhabitants built their houses of stone; and the place has since been strongly fortified. See HAVANNAH.

According to the Abbe Raynal, the Spanish settlement at Cuba is very important, on three accounts: 1. The produce of the country, which is considerable. 2. As being the staple of a great trade; and, 3. As being the key to the West Indies. The principal produce of this island is cotton. The commodity, however, through neglect, is now become so scarce, that sometimes several years pass without any of it being brought into Europe. In place of cotton, coffee has been cultivated: but, by a similar negligence, that is produced in no great quantity; the whole produce not exceeding 30 or 35 thousand weight, one-third of which is exported to Vera Cruz, and the rest to Madrid. The cultivation of coffee naturally leads to that of sugar; and this, which is the most valuable production of America, would of itself be sufficient to give Cuba that state of prosperity for which it seems designed by nature. Although the surface of the island is in general uneven and mountainous, yet it has plains sufficiently extensive, and well enough watered, to supply the consumption of the greatest part of Europe with sugar. The incredible fertility of its new lands, if properly managed, would enable it to surpass every other nation, however they may have now got the start of it: yet such is the indolence of the Spaniards, that to this day they have but few plantations, where, with the finest canes, they make but a small quantity of coarse sugar at a great expence. This serves partly for the Mexican market, and partly for the mother-country; while the indolent inhabitants are content to import sugar for themselves at the expence of near 220,000l. annually. It has been expected with probability, that the tobacco imported from Cuba would compensate this loss; for after furnishing Mexico and Peru, there was sufficient, with the little brought from Caracca and Buenos Ayres, to supply all Spain. But this trade too has declined through the negligence of the court of Madrid, in not gratifying the general taste for tobacco from the Havannah. The Spanish colonies have an universal trade in skins; and Cuba supplies annually about 10 or 12 thousand. The number might easily be increased in a country abounding with wild cattle where some gentlemen possess large tracts of ground, that for want of population can scarce be applied to any other purpose than that of breeding cattle. The hundredth part of this island is not yet cleared. The true plantations are all confined to the beautiful plains of the Havannah, and even those are not what they might be. All these plantations together may employ about 25000 male and female slaves. The number of whites, mestees, mulattoes, and free negroes, upon the whole island, amounts to about 30000. The food of these different species consists of excellent pork, very bad beef, and cassava bread. The colony would be more flourishing, if its productions had not been made the property of a company, whose exclusive privilege operates as a constant and invariable principle of discouragement. If any thing could supply the want of an open trade, and atone for the grievances occasioned by this monopoly at Cuba, it would be the advantage which this island has for
such

Cucbe
Cucubalus.

such a long time enjoyed, in being the rendezvous of almost all the Spanish vessels that sail to the new world. This practice commenced almost with the colony itself. Ponce de Leon, having made an attempt upon Florida in 1512, became acquainted with the new canal of Bahama. It was immediately discovered that this was the best route the ships bound from Mexico to Europe could possibly take; and to this the wealth of the island is principally, if not altogether, owing.

CUBE, in geometry, a solid body consisting of six equal sides. See **GEOMETRY**.

CUBE-Root of any Number, or Quantity, is such a number or quantity, which, if multiplied into itself, and then again the product thence arising by that number or quantity, being the cube-root, this last product shall be equal to the number or quantity whereof it is the cube-root; as 2 is the cube-root of 8; because two times 2 is 4, and two times 4 is 8; and $a + b$ is the cube-root of $a^3 + 3aab + 3abb + b^3$. See **ALGEBRA**, n° 8, p.

CUBEBS, in the materia medica, a small dried fruit, resembling a grain of pepper, but often somewhat longer, brought into Europe from the island of Java. In aromatic warmth and pungency, they are far inferior to pepper.

CUBIC EQUATION. See **ALGEBRA**, n° 22.

CUBIDIA, a genus of spars. The word is derived from *κῦβος* "a die;" and is given them from their being of the shape of a common die, or of a cubic figure. These bodies owe this shape to an admixture of lead, and there are only two known species of the genus. 1. A colourless crystalline one, with thin flakes, found in the lead-mines of Yorkshire, and some other parts of the kingdom; and 2. A milky white one with thicker crusts. This is found in the lead-mines of Derbyshire and Yorkshire, but is usually small, and is not found plentifully.

CUBIT, in the mensuration of the ancients, a long measure, equal to the length of a man's arm, from the elbow to the tip of the fingers.

Dr Arbuthnot makes the English cubit equal to 18 inches; the Roman cubit equal to 1 foot 5.406 inches; and the cubit of the scripture equal to 1 foot, 9.888 inches.

CUCKING-STOOL, an engine invented for punishing scolds and unquiet women, by ducking them in water; called in ancient time a *tumbrel*, and sometimes a *trebuchet*. In Domestday, it is called *cathedra stercoris*: and it was in use even in the Saxons time, by whom it was described to be *cathedra in qua rixosæ mulieres sedentes aquis demergebantur*. It was anciently also a punishment inflicted upon brewers and bakers transgressing the laws; who were thereupon in such a stool immersed over head and ears in *stercore*, some stinking water. Some think it a corruption from *ducking-stool*; others from *choaking-stool*, *quia hoc modo demersæ aquis sese suffocantur*. See **CASTIGATORY**.

CUCKOW, in ornithology. See **CUCULUS**.

CUCKOW-SPIR, the same with *stoth-spirit*. See **FROTH-SPIR**, and **CICADA**.

CUCUBALUS, BERRY-BEARING CHICKWEED; a genus of the trigynia order, belonging to the decan-

dria class of plants. There are 13 species, the most remarkable of which are,

Cucubalus
Cuculus.

1. The beken, Swedish lychnis, or gumfepungar, is a native of several parts of Europe. The empalement of its flower is curiously wrought like a network, and is of a purplish colour. The leaves have somewhat of the flavour of pease, and proved of great use to the inhabitants of Minorca in 1685, when a swarm of locusts had destroyed the harvest. The Gothlanders apply the leaves to erysipelatous eruptions. Horses, cows, sheep and goats, eat this plant.

2. The noctiflora, or night-flowering lychnis, grows naturally in Spain and Italy. It is a perennial plant, rising with an upright branching stalk, a foot and an half high, garnished with very narrow leaves placed opposite. The upper part of the stalk branches very much; the flowers stand upon long naked foot-stalks, each supporting three or four flowers which have long tubes with striped empalements: the petals are large, deeply divided at top, and of a pale-bluish colour. The flowers are closed all the day; but when the sun leaves them they expand, and then emit a very agreeable scent. It may be propagated by seeds sown in the spring on a bed of light earth; and when the plants are fit to remove, they should be planted in a nursery-bed at about four inches distance, where they may remain till autumn. They may then be planted in the borders where they are to remain, and will flower the following year.

3. The otter, or catch-fly, is a native of Britain, and other European countries. It hath a thick, fleshy, perennial root, which strikes deep into the ground, from whence rises a jointed stalk three or four feet high. At the joints there exudes a viscid clammy juice, that sticks to the fingers when handled; and the small insects which settle upon those parts of the stalks are thereby so fastened that they cannot get off. The flowers are small, and of a greenish colour. The plant is propagated by seeds.

CUCULUS, the CUCKOW, in ornithology, a genus belonging to the order of picæ. This singular bird appears in our country early in the spring, and makes the shortest stay with us of any bird of passage; it is compelled here, as Mr Stillingfleet observes, by that constitution of the air which causes the fig-tree put forth its fruit. It is very probable that these birds, or at least part of them, do not quit this island during the winter; but that they seek shelter in hollow trees and lie torpid, unless animated by unusually warm weather. Mr Pennant gives two instances of their being heard in February; one in 1771, in the end of that month; the other in 1769, on the 4th day; but after that, they were heard no more, being probably chilled again into torpidity. There is a remarkable coincidence between the song of these birds and the mac-karel's continuing in full roe; that is, from about the middle of April to the latter end of June. The cuckow is silent for some time after his arrival; his note is a call to love, and used only by the male, who sits perched generally on some dead tree or bare bough, and repeats his song, which he loses as soon as the amorous season is over. His note is so uniform, that his name in all languages seems to have been derived

Cuculus. ved from it; and in all countries it is used in the same reproachful sense :

The plain-song *cuckoo* grey,

Whose note full many a man doth mark,

And dares not answer nay.

Shakspear.

The reproach seems to arise from the cuckow's making use of the hed or nest of another to deposit its eggs in, leaving the care of its young to an improper parent ; but Juvenal with more justice gives the infamy to the bird in whole nest the supposititious eggs were laid :

Tu tibi tunc corruca paces.

A water-wagtail, a yellow-hammer, or hedge-sparrow, is generally the nurse of the young cuckows ; who if they happen to be hatched at the same time with the genuine offspring, quickly destroy them by over-laying them, as their growth is soon so greatly superior. The reason of this seeming want of natural affection in the cuckow, hath been long a question. It seems most probably to arise from the difference between the situation of the stomach in the cuckow and in other birds. The stomach of birds is situated quite in a different manner from what it is in other animals ; being almost joined to the back, secured by the bones of the reins, and covered before by the intestines, behind which it lies securely defended and concealed. This situation affords them a great facility and security of sitting on their eggs and young ; since the parts which lie immediately upon them are soft, warm, and pliable, and without danger from the compression, which would be hazardous, if the weight of a large and full stomach was to rest upon them, as in the very case of the cuckow. Besides, this singular structure secures a warm covering to the egg in hatching, and to the young as soon as hatched ; for their tender stomachs being defended from the impression of the cold air by a thin bone or cartilage only, would soon lose the warmth necessary to digestion, if it were not supplied by the incubation of the mother from time to time. The stomach of a cuckow, on the contrary, lies far forward, just under the integuments, and actually covers the intestines, the very reverse of what takes place in other birds. The cuckow's stomach is a large bag of uncommon capacity, adhering by a cellular tissue to all the parts that environ it, reaching all the way from the breast-bone to the vent. From such a structure and situation of the stomach, it naturally follows, that it is as difficult for a cuckow as it is easy for other birds to sit upon her eggs and young ; for the thin membranes of its large stomach charged so long with the weight of its whole body, together with the aliments contained therein, would prove an intolerable compression both to it and its tender young. It also follows from the peculiar structure of this bird, that its young do not stand in need of being covered like those of other birds ; their large and capacious stomachs being better secured from cold by means of lying covered under the mass of intestines.

This bird has been ridiculously believed to change into a hawk, and to devour its nurse on quitting the nest ; whence the French proverb, " Ingrat comme un coucou." But it feeds on no larger animals than worms and insects. It grows very fat, and is said to be as good eating as a land-rail. The French and Ita-

lians eat them to this day. The Romans admired them greatly as a food. Pliny says that there is no bird which can compare with them for delicacy.

The weight of the cuckow is little more than five ounces : the length 14 inches ; the breadth 25. The bill is black, very strong, a little incurved, and about two thirds of an inch in length. The head, hind part of the neck, coverts of the wings and rump, are of a dove colour ; darker on the head, and paler on the rump. The throat and upper part of the neck are of a pale grey ; the breast and belly white, crossed elegantly with undulated lines of black. The tail consists of ten feathers of unequal lengths ; the two middle are black tipped with white ; the others are marked with white spots on each side their shafts. The legs are short ; and the toes disposed two backwards, and two forwards, like those of the woodpecker, though it is never observed to run up the sides of trees. The female differs in some respects. The neck before and behind is of a brownish-red ; the tail barred with the same colour, and black, and spotted on each side the shaft with white. The young birds are brown mixed with black, and in that state have been described by some authors as old ones.

Linnæus enumerates no fewer than 22 species of this genus, which inhabit different parts of the globe, and are chiefly distinguished by the shape of the tail, and variations in colour. The most remarkable are,

1. The Americanus, or cuckow of Carolina. It is about the size of a blackbird ; the bill a little hooked and sharp ; the upper mandible black, the lower yellow ; the large wing-feathers are reddish ; the rest of the wing, and all the upper part of the body, head and neck, is of an ash-colour ; all the under part of the body, from the bill to the tail, white ; the tail long and narrow, composed of six long and four shorter feathers,—the two middlemost ash-coloured, the rest black with their ends white ; their legs short and strong, having two back toes, and two before. Their note is very different from the cuckow of this country, and not so remarkable to be taken notice of. It is a solitary bird, frequenting the darkest recesses of woods and shady thickets. They retire on the approach of winter.

2. The indicator, or honey-guide, is a native of Africa. The following description is given of it by Dr Sparrman in the Philosophical Transactions for 1777. " This curious species of cuckow is found at a considerable distance from the Cape of Good Hope, in the interior parts of Africa, being entirely unknown at that settlement. The first place I heard of it was in a wood called the *Groot-vader's Bosch*, " the Grand-father's Wood," situated in a desert near the river which the Hottentots call *T'kau'kai*. The Dutch settlers thereabouts have given this bird the name of *honinguizer*, or " honey-guide," from its quality of discovering wild honey to travellers. Its colour has nothing striking or beautiful. Its size is considerably smaller than that of our cuckow in Europe ; but in return, the instinct which prompts it to seek its food in a singular manner is truly admirable. Not only the Dutch and Hottentots, but likewise a species of quadruped named *ratel*, (probably a new species of badger), are frequently conducted to wild bee-hives by this bird, which, as it were, pilots them to the very spot. The honey

cucumber
Cucumis.

honey being its favourite food, its own interest prompts it to be instrumental in robbing the hive, as some scraps are commonly left for its support. The morning and evening are its times of feeding, and it is then heard calling in a shrill tone, *cherr, cherr*; which the honey-hunters carefully attend to as the summons to the chase. From time to time they answer with a soft whistle; which the bird hearing, always continues its note. As soon as they are in sight of each other, the bird gradually flutters toward the place where the hive is situated, continually repeating its former call of *cherr, cherr*: nay, if it should happen to have gained a considerable way before the men, (who may easily be hindered in the pursuit by bushes, rivers, or the like), it returns to them again, and redoubles its note, as if it were to reproach them with their inactivity. At last the bird is observed to hover for a few moments over a certain spot, and then silently retiring to a neighbouring bush or resting-place, the hunters are sure of finding the bees nest in that identical spot, whether it be in a tree or in the crevice of a rock, or (as is most commonly the case) in the earth. Whilst the hunters are busy in taking the honey, the bird is seen looking on attentively to what is going forward, and waiting for its share of the spoil. The bee-hunters never fail to leave a small portion for their conductor; but commonly take care not to leave so much as would satisfy its hunger. The bird's appetite being whetted by this parsimony, it is obliged to commit a second treason, by discovering another bee's nest, in hopes of a better salary. It is further observed, that the nearer the bird approaches the hidden hive, the more frequently it repeats its call, and seems the more impatient.

"I have had frequent opportunities of seeing this bird, and have been witness to the destruction of several republics of bees by means of its treachery. I had, however, but two opportunities of shooting it, which I did to the great indignation of my Hottentots. It is about seven inches in length, and is of a rusty brown colour on the back, with a white breast and belly." See Plate LXXXVI.

CUCUMBER, in botany. See CUCUMIS.

CUCUMIS, the CUCUMBER; a genus of the syn-genefia order, belonging to the monœcia class of plants. In this genus Linnaeus includes also the MELON; (see that article). There are 11 species, of which the following are the most remarkable.

1. The fativa, or common cucumber, hath roots composed of numerous, long, slender, white fibres; long slender stalks, very branchy at their joints, trailing on the ground, or climbing by their clasping, adorned at every joint by large angular leaves on long erect footstalks, with numerous monopetalous bell-shaped flowers of a yellow colour, succeeded by oblong rough fruit. The varieties of this kind are, (1.) The common rough green prickly cucumber; a middle-sized fruit, about six or seven inches long, having a dark-green rough rind, closely set with very small prickles; the plant is of the hardiest sort, but does not shew its fruit early. (2.) The short green prickly cucumber is about three or four inches long; the rind rather smooth, and set with small black prickles. It is valuable chiefly for being one of the

earliest and hardiest sorts. (3.) The long green prickly cucumber, grows from six to nine inches in length, and is rather thinly set with prickles. And as there is an early and late cucumber, it is considerably the best variety for the main crops, both in the frames and hand-glass, as well as in the open ground for pricklers. Of this there is another variety with white fruit. (4.) The early green cluster cucumber is a shortish fruit, remarkable for growing in clusters, and appearing early. (5.) The long smooth green Turkey cucumber, is a smooth green-rinded fruit, growing from 10 to 15 inches in length, without prickles. The plants are strong growers, with very large leaves. (6.) The long smooth white Turkey cucumber, is a smooth-rinded fruit, from 10 to 15 inches long, without prickles. (7.) The large smooth green Roman cucumber is a very large and long smooth green fruit produced from a strong growing plant. (8.) The long white prickly Dutch cucumber, is a white fruit 8 or 10 inches long, set with small black prickles; the plants are but bad bearers in this country.

2. The chata, or round-leaved Egyptian cucumber. According to Mr Haffelquist, this grows in the fertile earth near Cairo after the inundation of the Nile, and not in any other place in Egypt, nor does it grow in any other soil. It ripens with the water-melons. The fruit is a little watery; the flesh almost of the same substance with the melons; it tastes somewhat sweet and cool; but is far from being as cool as the water-melons. This the grandees and Europeans in Egypt eat as the most pleasant fruit they find, and that from which they have the least to apprehend. It is the most excellent fruit of this tribe of any yet known.

The four first varieties of the cucumis fativa are those chiefly cultivated in this country. They are raised at three different seasons of the year: 1. on hot-beds, for early fruit; 2. under bell, or hand-glasses, for the middle crop; 3. on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholesome; being raised wholly by the heat of the dung without the assistance of the sun. Those raised in April are good, and are raised in the following manner.

Towards the latter end of January, a quantity of fresh horse-dung must be procured with the litter among it; and a small proportion of sea-coal ashes should be added to it. In four or five days the dung will begin to heat; at which time a little of it may be drawn flat on the outside, and covered with two inches thickness of good earth: this must be covered with a bell-glass; and after two days, when the earth is warm, the seeds must be sown on it, covered with a quarter of an inch of fresh earth, and the glass then set on again. The glass must be covered with a mat at night, and in four days the young plants will appear. When these are seen, the rest of the dung must be made up into a bed for one or more lights. This must be three feet thick, beat close together, and covered three inches deep with fine fresh earth; the frame must then be put on, and covered at night, or in bad weather, with mats. When the earth is hot enough, the young plants from under the bell must be removed into it, and set at two inches distance. The glasses must be now and then a little raised, to give

Cucumis.

air to the plants, and turned often, to prevent the wet from the steam of the dung from dropping down upon them. The plants must be watered at proper times; and the water used for this purpose must be set on the dung till it becomes as warm as the air in the frame: and as the young plants increase in bulk, they must be earthed up, which will give them great additional strength. If the bed is not hot enough, some fresh litter should be laid round its sides; and if too hot, some holes should be bored into several parts of it with a stake, which will let out the heat; and when the bed is thus brought to a proper coolness, the holes are to be stopped up again with fresh dung. When these plants begin to shoot their third, or rough leaf, another bed must be prepared for them like the first; and when it is properly warm through the earth, the plants of the other bed must be taken up, and planted in this, in which there must be a hole in the middle of each light, about a foot deep, and nine inches over, filled with light and fine fresh earth laid hollow in form of a basin: in each of these holes there must be set four plants: these must be, for two or three days, shaded from the sun, that they may take firm root; after which they must have all the sun they can, and now and then a little fresh air, as the weather will permit. When the plants are four or five inches high, they must be gently pegged down towards the earth, in directions as different from one another as may be; and the branches afterwards produced should be treated in the same manner. In a month after this the flowers will appear, and soon after the rudiments of the fruit. The glasses should now be carefully covered at night; and in the daytime the whole plants should be gently sprinkled with water. These will produce fruit till about midsummer; at which time the second crop will come in to supply their place: these are to be raised in the same manner as the early crop, only they do not require so much care and trouble. This second crop should be sown in the end of March, or beginning of April. The season for sowing the cucumbers of the last crop, and for pickling, is towards the latter end of May, when the weather is settled: these are sown in holes dug to a little depth and filled up with fine earth, so as to be left in the form of a basin; eight or nine seeds being put into one hole. These will come up in five or six days, and till they are a week old, are in great danger from the sparrows. After this they require only to be kept clear of weeds, and watered now and then. There should be only five plants left at first in each hole; and when they are grown a little farther up, the worst of these is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

The cucumber is taken in great cities by the lower people as nourishment; but by the better sort is chiefly used as a refrigerant, or condiment, to accompany animal food. They have a bland insipid juice, without acidity or sweetness, approaching, as appears by their ripening, to a farinaceous matter. When used green they have no nourishment, so they are only to be used in the summer season and by the sedentary. Although cucumbers are neither sweet nor acid, yet they are considerably acescent, and so produce flatu-

lency, cholera, diarrhoea, &c. Their coldness and flatulency may be likewise in part attributed to the firmness of their texture. They have been discharged with little change from the stomach, after being detained there for 48 hours. By this means, therefore, their acidity is greatly increased. Hence oil and pepper, the condiments commonly employed, are very useful to check their fermentation. We have lately used another condiment, viz. the skin, which is bitter, and may therefore supply the place of aromatics; but should only be used when young.

Besides the above-mentioned species which are proper for the table, this genus affords also two articles for the materia medica.

1. The elaterium of the shops, is the inspissated fecula of the juice of a kind of wild cucumber, called also the ass's cucumber, a species of balsam apple. It comes to this country from Spain and the southern parts of France, where the plant is very common. It is brought to us in small flat whitish lumps or cakes that are dry, and break easily between the fingers. It is of an acrid, bitter, and nauseous taste, and has a strong offensive smell when newly made: but these, as well as its other qualities it loses after being kept some time. Elaterium is a very violent purge and vomit, and is now very seldom used. The plant is commonly called spirting cucumber, from its casting out its seeds with great violence, together with the viscid juice in which they are lodged, if touched when ripe: from this circumstance it has obtained the appellation of *noli me tangere*, or "touch me not."

2. The colocynthis, the colocynth, coloquintida, or bitter apple of the shops, is brought to us from Aleppo and the island of Crete. The leaves of the plant are large, placed alternate, almost round, and stand upon footstalks four inches long. The flowers are white; and are succeeded by a fruit of the gourd kind, of the size of a large apple, and which is yellow when ripe. The shelly or hulky outside incloses a bitter pulp interspersed with flatulif seeds. If a hole is made in one of these ripe gourds, and a glass of rum poured in, and suffered to remain 24 hours, it proves a powerful purgative. The pulp itself dried and powdered is commonly used as a purgative in this country, but is one of the most drastic and disagreeable we know. If taken in a large dose, it not only often brings away blood, but produces colics, convulsions, ulcers in the bowels, and fatal super-purgations. The most effectual corrector of these virulent qualities is to triturate it finely with sugar, or sweet almonds.

CUCURBITA, the name of a chemical vessel employed in distillation, when covered with its head. Its name comes from its lengthened shape, by which it resembles a gourd: some cucurbits, however, are shallow, and wide-mouthed. They are made of copper, tin, glass, and stone-ware, according to the nature of the substances to be distilled. A cucurbit, provided with its capital, constitutes the vessel for distillation called an *alembic*. See CHEMISTRY, n° 80. and Plate LXXXVII. fig. 5. 6.

CUCURBITA, the GOURD, and POMPION; a genus of the syngenesia order, belonging to the monœcia class of plants. There are five species.

1. The lagenaria, or bottle gourd, rises with thick trailing

Cucurbit

Cucurbita.

curbata. trailing downy stalks, branching into many spreading runners. These extend along the ground sometimes 15 or 20 feet in length. The leaves are large, roundish, heart-shaped, indented, and woolly. The flowers are large and white, succeeded by long incurved whitish yellow fruit, obtaining from about two to five or six feet in length, and from about nine to 24 inches in circumference, having a ligueous and durable shell.

2. The papo or pompon, commonly called pumpkin, hath strong, trailing, rough stalks, branching into numerous runners. These are much larger than the former, extending from 10 to 40 or 50 feet each way. These are garnished with large, roundish, lobated, rough leaves, and yellow flowers. The flowers are succeeded by large, round, smooth fruit, of different forms and sizes; some as big as a peck, others as big as half a bushel measure; some considerably less, and others not exceeding the bulk of an orange; ripening to a yellow, and sometimes to a whitish, colour. This species is the most hardy of any, as well as the most extensive in their growth. A single plant, if properly encouraged, will overspread 10 or 15 roods of ground, and produce a great number of fruit, which, when young, are generally a mixture between a deep blue and pale white, but change as they increase in bulk.

3. The verrucosa, or warted gourd, hath trailing stalks very branchy, and running upon the ground 10 or 15 feet each way; large lobated leaves, and yellow flowers, succeeded by roundish, knobby, warted white fruit, of moderate size.

4. The melopepo, erect gourd, or squash. This rises with an erect strong stalk several feet high, rarely sending forth side-runners, but becoming bushy upward. It is adorned with large lobated leaves; and the flowers are succeeded by depressed knotty fruit, both white and yellow, commonly of a moderate size.

5. The lignosa, ligneous shelled gourd, often called calabash. This hath trailing stalks, branching into runners, which extend far every way; the leaves are large, lobated, and rough; the flowers yellow, and are succeeded by roundish smooth fruit of a moderate size, with hard woody shells. Of all these species there are a great many varieties, and the fruit of every species is observed to be surprisingly apt to change its form.

Culture. All the species of gourds and pompons, with their respective varieties, are raised from seed sown annually in April or the beginning of May, either with or without the help of artificial heat. But the plants forwarded in a hot-bed till about a month old, produce fruit a month or six weeks earlier on that account, and ripen proportionably sooner. The first species particularly will scarce ever produce tolerably sized fruit in this country, without the treatment above-mentioned.

Uses. In this country these plants are cultivated only for curiosity; but in the places where they are natives, they answer many important purposes. In both the Indies, bottle-gourds are very commonly cultivated and sold in the markets. They make the principal food of the common people, particularly in the warm months of June, July, and August. The Arabians call this kind of gourd *charrah*. It grows commonly on the mountains in these deserts. The na-

tives boil and season it with vinegar; and sometimes, filling the shell with rice and meat, make a kind of pudding of it. The hart shell is used for holding water, and some of them are capacious enough to contain 22 gallons; these, however, are very uncommon. The fruit of the pompon likewise constitutes a great part of the food of the common people during the hot months, in those places where they grow. If gathered when not much bigger than a hen or goose egg, and properly seasoned with butter, vinegar, &c. they make a tolerable good sauce for butcher's meat, and are also used in soups. In England they are seldom used till grown to maturity. A hole is then made in one side, through which the pulp is scooped out; after being divested of the seeds, it is mixed with sliced apples, milk, sugar, and grated nutmeg, and thus a kind of pudding is made. The whole is then baked in the oven, and goes by the name of a *pumpkin pye*. For this purpose the plants are cultivated in many places of England by the country people, who raise them upon old dung hills. The third species is also used in North America for culinary purposes. The fruit is gathered when about half grown, boiled, and eaten as sauce to butcher's meat. The squashes are also treated in the same manner, and by some people esteemed delicate eating.

CUCURBITACEÆ, the name of the 34th order in Linnæus's fragments of a natural method, consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities. This order contains the following genera, *viz.* *gronovia*, *melothria*, *passiflora*, *anguria*, *bryonia*, *cucumis*, *cucurbita*, *sevillea*, *momordica*, *sicyos*, *trichofanthus*.

CUCURUCU, in zoology, the name of a serpent found in America, growing 10 or 12 feet long. It is also very thick in proportion to its length, and is of a yellowish colour, strongly variegated with black spots, which are irregularly mixed among the yellow, and often have spots of yellow within them. It is a very poisonous species, and greatly dreaded by the natives; but its flesh is a very rich food, and much esteemed among them, when properly prepared.

CUD, sometimes means the inside of the throat in beasts; but generally the food that they keep there, and chew over again. See **COMPARATIVE ANATOMY**, p. 88—90.

CUDWEED, in botany. See **GNAPHALUM**.

CUDWORTH (Ralph), a very learned divine of the church of England in the 17th century. In January 1657 he was one of the persons nominated by a committee of the parliament to be consulted about the English translation of the Bible. In 1678 he published his *True Intellectual System of the Universe*; a work which met with great opposition. He likewise published a treatise, intitled, *Deus justificatus*; or, "The divine goodness of God vindicated, against the assertions of absolute and unconditionate reprobation." He embraced the mechanical or corpuscular philosophy; but with regard to the deity, spirits, genii, and ideas, he followed the Platonists. He died at Cambridge in 1688. The late earl of Shaftesbury styles him an excellent and learned divine, of highest authority at home, and fame abroad. His daughter Damaris, who married Sir Francis Masham of Oates in Essex, was a lady

*Cucurbita-
cce
i
Cudworth.*

Cuenza
Cujas.Cujava
Culm.

of genius and learning: she had a great friendship for Mr Locke, who resided several years at her house at Oates, where he died in 1704.

CUENZA, a town of Spain, in New Castile, and in the territory of the Sierra, with a bishop's see. It was taken by lord Peterborough in 1706, but retaken by the duke of Berwick. It is seated on the river Xucar, in W. Long. 1. 45. N. Lat. 40. 10.

CUFF (Henry), the unfortunate secretary of the unfortunate earl of Essex, was born at Hinton St George in Somersetshire, about the year 1560, of a genteel family, who were possessed of considerable estates in that county. In 1576, he was entered of Trinity college, Oxford; where he soon acquired considerable reputation as a Grecian, and disputant. He obtained a fellowship in the above-mentioned college; but was afterwards expelled for speaking disrespectfully of the founder*. He was, however, soon after admitted of Merton college; of which, in 1586, he was elected probationer, and, in 1588, fellow. In this year he took the degree of master of arts. Some time after, he was elected Greek professor, and, in 1594, proctor of the university.

When he left Oxford is uncertain; nor are we better informed as to the means of his introduction to the earl of Essex. When that nobleman was made lord lieutenant of Ireland, Mr Cuff was appointed his secretary, and continued intimately connected with his lordship until his confinement in the tower; and he is generally supposed to have advised those violent measures which ended in their mutual destruction. The earl indeed confessed as much before his execution, and charged him, to his face, with being the author of all his misfortunes. Mr Cuff was tried for high-treason, convicted, and executed at Tyburn on the 30th of March 1601. Lord Bacon, Sir Henry Wotton, and Camden, speak of him in very harsh terms. He was certainly a man of learning and abilities.

He wrote two books; the one intitled, *The Differences of the Ages of Man's Life*; the other, *De Rebus Gestis in Sancto Concilio Nicæno*. The first was published after his death; the second is still in manuscript.

CUJAS (James), in Latin *Cujacius*, the best civilian of his time, was born at Toulouse, of obscure parents, in 1520. He learned polite literature and history; and acquired great knowledge in the ancient laws, which he taught with extraordinary reputation at Toulouse, Cahors, Bourges, and Valence, in Dauphiné. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him singular marks of his esteem. Cujas afterwards refused very advantageous offers from pope Gregory XIII. who was desirous of having him teach at Bologna: but he chose rather to fix at Bourges, where he had a prodigious number of scholars; whom he not only took great pleasure in instructing, but assisted with his substance, which occasioned his being called the *Father of his Scholars*. He died at Bourges in 1590, aged 70. His works are in high esteem among civilians.

* The founder of Trinity college was Sir Thomas Pope, who, it seems, would often take a piece of plate from a friend's house, and carry it home, concealed under his gown; out of fun, no doubt. Cuff, being merry with some of his acquaintance at another college, happened to say, alluding to Sir Thomas Pope's usual joke above mentioned, "A pox on this beggarly house! why, 'our founder stole as much plate as would build such another.'" This piece of wit was the cause of his expulsion. The heads of colleges in those days did not understand humour. Anthony Wood was told this story by doctor Bathurst.

CUJAVA, a territory of Great Poland, having on the north the duchy of Prussia, on the west the palatinate of Kalisz, on the south those of Lici and Rawa, and on the west that of Plocko. It contains two palatinates, the chief towns of which are Inowloz and Brest; as also Uladslaw, the capital of the district.

CUIRASSE, a piece of defensive armour, made of iron plate, well hammered, serving to cover the body, from the neck to the girdle, both before and behind. Whence,

CUIRASSIERS, cavalry armed with cuirasses, as most of the Germans are: the French have a regiment of cuirassiers; but we have had none in the British army since the revolution.

CULDEES, in church-history, a sort of monkish priests, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, *cultores Dei*; from whence is derived the word *culdees*. They made choice of one of their own fraternity to be their spiritual head, who was afterwards called the *Scots bishop*.

CULEUS, in Roman antiquity, the largest measure of capacity for things liquid, containing 20 amphoræ, or 40 urnæ. It contained 143 gallons, 3 pints, English wine-measure; and was 11.095 solid inches.

CULEMBACH, a district or marquise of the circle of Franconia, in Germany. It is bounded on the west by the bishopric of Bamberg; on the south by the territory of Nuremberg; on the east by the palatinate of Bavaria and Bohemia; and on the north by Voightland and part of the circle of Upper Saxony. It is about 50 miles in length from north to south, and 30 in breadth from east to west. It is full of forests and high mountains; the most considerable of the latter are those of Frichtelberg, all of them covered with pine-trees. Here are the sources of four large rivers, the Maine, the Sala, the Eger, and the Nab. This marquise is the upper part of the burgraviat of Nuremberg.

CULEMBACH, a town of Germany, in Franconia, the capital of the marquise of the same name. It has good fortifications, and is seated at the confluence of two branches of the river Maine. It was pillaged and burnt by the Hussites in 1430, and by the inhabitants of Nuremberg in 1573. E. Long. 11. 28. N. Lat. 50. 12.

CULIACAN, a province of North America, in the audience of Cudalajara. It is bounded on the north by New Mexico, on the east by New Biscay and the Zacatecas, on the south by Chiametlan, and on the west by the sea. It is a fruitful country, and has rich mines.

CULLIAGE, a barbarous and immoral practice, whereby the lords of manors anciently assumed a right to the first night of their vassals' brides.

CULLEN, a parliament town in Scotland, situated on the sea-coast of Banff-shire. W. Long. 2. 12, and N. Lat. 57. 38.

CULM, or CULMUS, among botanists, a straw, or haulm;

Culmiferous.
Culverin.

haulm; defined by Linnaeus to be the proper trunk of the grasses, which elevates the leaves, flower, and fruit.

This sort of trunk is tubular, or hollow, and has frequently knots, or joints, distributed at proper distances through its whole length. The leaves are long, sleek, and placed either near the root in great numbers, or proceed singly from the different joints of the stalk, which they embrace at the base, like a sheath, or glove.

The haulm is commonly garnished with leaves: sometimes, however, it is naked; that is, devoid of leaves, as in a few species of cyperis-grass. Most grasses have a round cylindrical stalk; in some species of *sclærus*, *scirpus*, cyperis-grass, and others, it is triangular.

The stalk is sometimes entire, that is, has no branches; sometimes branching, as in *sclærus aculeatus* & *capensis*; and not seldom consists of a number of scales, which lie over each other like tiles.

Lastly, in a few grasses, the stalk is not interrupted with joints, as in the greater part. The space contained betwixt every two knots, or joints, is termed by botanists *internodium*, and *articulus culmi*.

This species of trunk often affords certain marks of distinction, in discriminating the species. Thus in the genus *ericaulon*, the species are scarce to be distinguished but by the angles of the culmus, or stalks. There in some species are in number 5, in others 6, and in others 10.

CULMIFEROUS PLANTS, (from *culmus*, a straw or haulm): plants so called, which have a smooth jointed stalk, usually hollow, and wrapped about at each joint with single, narrow, sharp-pointed leaves, and the seeds contained in chaffy husks; such are oats, wheat, barley, rye, and the other plants of the natural family of the GRASSES.

CULMINATION, in astronomy, the passage of any heavenly body over the meridian, or its greatest altitude for that day.

CULPRIT, a term used by the clerk of the arraignments, when a person is indicted for a criminal matter. See *PLEA to Indictment*, par. 11.

CULROSS, a parliament town in Scotland, situated on the river Forth, about 23 miles north-west of Edinburgh. W. Long. 3. 34. N. Lat. 56. 8.

CULVERIN, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance. Menage derives the word from the Latin *culubrina*; others from *culuber*, snake; either on account of the length and slenderness of the piece, or of the ravages it makes.

There are three kinds of culverins, *viz.* the extraordinary, the ordinary, and the least sized. 1. The culverin extraordinary has $5\frac{1}{2}$ inches bore; its length 32 calibers, or 13 foot; weighs 4800 pound; its load above 12 pound; carries a shot $5\frac{1}{2}$ inches diameter, weighing 20 pound weight. 2. The ordinary culverin is 12 foot long; carries a ball of 17 pound 5 ounces; caliber $5\frac{1}{2}$ inches; its weight 4500 pound. 3. The culverin of the least size, has its diameter 5 inches; is 12 foot long; weighing about 4000 pounds; carries a shot $3\frac{1}{2}$ inches diameter, weighing 14 pounds 9 ounces.

VOL. III

Culvert-tailed
Cuminum.

CULVERTAILED, among shipwrights, signifies the fastening or letting of one timber into another, so that they cannot slip out, as the corlings into the beams of a ship.

CUMBERLAND, **CUMBRIA**, so denominated from the *Cumri* or Britons who inhabited it; one of the most northerly counties in England. It was formerly a kingdom extending from the vallum of Adrian to the city of Dunbriton, now Dumbarton, on the frith of Clyde in Scotland. At present it is a county of England, which gives the title of *duke* to one of the royal family. It is bounded on the north and north-west by Scotland; on the south and south-east by part of Lancashire and Westmoreland; it borders on the east with Northumberland and Durham; and on the west is washed by the Irish sea. The length from north to south may amount to 55 miles, but the breadth does not exceed 40. It is well watered with rivers, lakes, and fountains; but none of its streams are navigable. In some places there are very high mountains. The air is keen and piercing on these mountains towards the north; and the climate is moist, as in all hilly countries. The soil varies with the face of the country; being barren on the moors and mountains, but fertile in the vallies and level ground bordering on the sea. In general the eastern parts of the shire are barren and desolate; yet even the least fertile parts are rich in metals and minerals. The mountains of Copland abound with copper: veins of the same metal, with a mixture of gold and silver, were found in the reign of queen Elizabeth among the fells of Derwent; and royal mines were formerly wrought at Kewick. The county produces great quantities of coal; some lead; abundance of the mineral earth called *black-lead*; several mines of lapis calaminaris; and an inconsiderable pearl-fishery on the coast near Ravenglafs.

CUMBERLAND (Richard), a very learned English divine in the latter end of the 17th century, was son of a citizen of London, and educated at Cambridge. In 1672, he published his excellent "Treatise of the Laws of Nature;" and in 1686, "An Essay toward the Jewish Weights and Measures." After the revolution he was nominated by king William to the bishopric of Peterborough, without the least solicitation on his part. He pursued his studies to the last; and the world is obliged to him for clearing up several difficulties in history, chronology, and philosophy. After the age of 83, he applied himself to the study of the Coptic language, of which he made himself master. He was as remarkable for humility of mind, benevolence of temper, and innocence of life, as for his extensive learning. He died in 1718.

CUMINUM, **CUMIN**, a genus of the digynia order, belonging to the pentandria class of plants. There is but one species, *viz.* the cyminum. It is an annual plant, perishing soon after the seed is ripe. It rises 9 or 10 inches high in the warm countries where it is cultivated; but seldom rises above four in this country. It has sometimes flowered very well here, but never brings its seeds to perfection. The leaves are divided into long narrow segments, like those of fennel, but much smaller: they are of a deep green, and generally turned backward at their extremity: the flowers grow

13 R

in

Cuneus in small umbels at the top of the stalks; they are composed of five unequal petals, of a pale bluish colour, which are succeeded by long, channelled, aromatic seeds. The plant is propagated for sale in the island of Malta. In this country the seeds must be sown in small pots, and plunged in a very moderate hot-bed to bring up the plants. These, after having been gradually inured to the open air, turned out of the pots, and planted in a warm border of good earth, preserving the balls of earth to their roots, will flower pretty well, and may perhaps even perfect a few seeds in warm seasons. These seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind. They are accounted good carminatives; but not very often made use of. An essential oil of them is kept in the shops.

CUNEUS (Peter), born in Zealand, in 1586, was distinguished by his knowledge in the learned languages, and his skill in the Jewish antiquities. He also studied law, which he taught at Leyden, in 1615; and read politics there till his death, in 1638. His principal work is a treatise, in Latin, on the Republic of the Hebrews.

CUNEIFORM, in general, an appellation given to whatever resembles a wedge.

CUNEIFORM-Bone, in anatomy, the seventh bone of the cranium, called also *os basilare*, and *os sphenoides*. See **ANATOMY**, n° 15.

CUNEUS, in antiquity, a company of infantry drawn up in form of a wedge, the better to break through the enemy's ranks.

CUNICULUS, in zoology. See **LEPUS**.

CUNICULUS, in mining, a term used by authors in distinction from *puteus*, to express the several sorts of passages and cuts in these subterranean works. The *cuniculi* are those direct passages in mines where they walk on horizontally; but the *putei* are the perpendicular cuts or descents. The miners in Germany call these by the name *stollen*, and *schachts*; the first word expressing the horizontal, and the second the perpendicular cuts.

CUNILA, in botany, a genus of the monogynia order, belonging to the diandria class of plants. There are three species, none of which has any remarkable property.

CUNITZ (Mary), one of the greatest geniuses in the 16th century, was born in Silesia. She learned languages with amazing facility; and understood Polish, German, French, Italian, Latin, Greek, and Hebrew. She attained a knowledge of the sciences with equal ease: she was skilled in history, physics, poetry, painting, music, and playing upon instruments; and yet these were only an amusement. She more particularly applied herself to the mathematics, and especially to astronomy, which she made her principal study, and was ranked in the number of the most able astronomers of her time. Her Astronomical Tables acquired her a prodigious reputation: she printed them in Latin and German, and dedicated them to the emperor Ferdinand III. She married Elias de Lewin, M. D.; and died at Piffen, in 1664.

CUNNINGHAM, one of the four bailiwicks in Scotland; and one of the three into which the shire of Air

is sub-divided. It lies north-east of Kyle. Its chief town is Irwin.

CUOGOLO, in natural history, the name of a stone much used by the Venetians in glass-making, and found in the river Fesino. It is a small stone of an impure white, of a flattery texture, and is of the shape of a pebble.

CUP, a vessel of capacity of various forms and materials, chiefly to drink out of. In the Ephem. German. we have a description of a cup made of a common pepper-corn by Oswald Nerlinger; which holds 1200 other ivory cups, having each its several handle, all gilt on the edges; with room for 400 more.

CUP-Galls, in natural history, a name given, by authors, to a very singular kind of galls found on the leaves of the oak, and some other trees. They are of the figure of a cup, or drinking-glass, without its foot, being regular cones adhering by their point or apex to the leaf; and the top or broad part is hollowed a little way, so that it appears like a drinking-glass with a cover, which was made so small as not to close it at the mouth, but fall a little way into it. This cover is flat, and has in the centre a very small protuberance, resembling the nipple of a woman's breast. This is of a pale green, as is also the whole of the gall, excepting only its rim that runs round the top: this is of a scarlet colour, and that very beautiful. Besides this species of gall, the oak leaves furnish us with several others, some of which are oblong, some round, and others flattened; these are of various sizes, and appear on the leaves at various seasons of the year. They all contain the worm of some small fly; and this creature passes all its changes in this its habitation, being sometimes found in the worm, sometimes in the nymph, and sometimes in the fly-state, in the cavity of it.

CUPANIA, in botany; a genus of the monogynia order, belonging to the pentandria class of plants. There is but one species, a native of America, and which possesses no remarkable property.

CUPEL, in metallurgy, a small vessel which absorbs metallic bodies when changed by fire into a fluid scoria; but retains them as long as they continue in their metallic state. One of the most proper materials for making a vessel of this kind is the ashes of animal bones; there is scarcely any other substance which so strongly resists vehement fire, which so readily imbibes metallic scoriz, and which is so little disposed to be vitrified by them. In want of these, some make use of vegetable ashes freed, by boiling in water from their saline matter, which would cause them melt in the fire.

The bones, burnt to perfect whiteness, so as that no particle of coaly or inflammable matter may remain in them, and well washed from filth, are ground into moderately fine powder; which, in order to its being formed into cupels, is moistened with just as much water as is sufficient to make it hold together when strongly pressed between the fingers; some direct glutinous liquids, as whites of eggs, or gum-water, in order to give the powder a greater tenacity: but the inflammable matter, however small in quantity, which accompanies these fluids, and cannot be easily burnt out from the internal part of the mass, is apt to revive

CUOGOLA
Cupel.

Cupellation

a part of the metallic scoria that has been absorbed, and to occasion the vessel to burst or crack. The cupel is formed in a brass ring, from three quarters of an inch to two inches diameter, and not quite so deep, placed upon some smooth support: the ring being filled with moistened powder, which is pressed close with the fingers; a round-faced pestle called a *monk*, is struck down into it with a few blows of a mallet, by which the mass is made to cohere, and rendered sufficiently compact, and a shallow cavity formed in the middle: the figure of the cavity is nearly that of a sphere, that a small quantity of metal melted in it, may run together into one bead. To make the cavity the smoother, a little of the same kind of ashes levigated into an impalpable powder, and not moistened is commonly sprinkled on the surface, through a small fine sieve, made for this purpose, and the monk again struck down upon it. The ring, or mould, is a little narrower at bottom than at top; so that by pressing it down on some of the dry powder spread upon a table, the cupel is loosened, and forced upwards a little; after which it is easily pushed out with the finger, and is then set to dry in a warm place free from dull.

CUPELLATION, the act of refining gold or silver by means of a cupel. For this purpose another vessel, called a *muffle* is made use of, within which one or more cupels are placed*. The muffle is placed upon a grate in a proper furnace, with its mouth facing the door, and as close to it as may be. The furnace being filled up with fuel, some lighted charcoal is thrown on the top, and what fuel is afterwards necessary, is supplied through a door above. The cupels are set in the muffle; and being gradually heated by the successive kindling of the fuel, they are kept red-hot for some time, that the moisture which they strongly retain may be completely dissipated: for if any vapours should issue from them after the metal is put in, they would occasion it to sputter, and a part of it to be thrown off in little drops. In the sides of the muffle are some perpendicular slits, with a knob over the top of each, to prevent any small pieces of coals or ashes from falling in. The door, or some apertures made in it, being kept open, for the inspection of the cupels, fresh air enters into the muffle, and passes off through these slits; by laying some burning charcoal, on an iron plate before the door, the air is heated before its admission; and by removing the charcoal or supplying more, the heat in the cavity of the muffle may be somewhat diminished or increased more speedily than can be effected by suppressing or exciting the fire in the furnace on the outside of the muffle. The renewal of the air also is necessary for promoting the scorification of the lead.

The cupel being of a full red heat, the lead cast into a smooth bullet, that it may not scratch or injure the surface, is laid lightly in the cavity: it immediately melts; and then the gold or silver to be cupelled are cautiously introduced either by means of a small iron ladle, or by wrapping them in paper, and dropping them on the lead with a pair of tongs. The quantity of lead should be at least three or four times that of the fine metal: but when gold is very impure, it requires 10 or 12 times its quantity of lead for cupellation. It is reckoned that copper requires for its

scorification about 10 times its weight of lead; that when copper and gold are mixed in equal quantities, the copper is so much defended by the gold as not to be separable with less than 20 times its weight of lead; and that when copper is in very small proportion, as a 20th or 30th part of the gold or silver, upwards of 60 parts of lead are necessary for one of the copper. The cupel must always weigh at least half as much as the lead and copper; for otherwise it will not be sufficient for receiving half the scoria: there is little danger, however, of cupels being made too small for the quantity of a gold alloy.

The mixture being brought into thin fusion, the heat is to be regulated according to the appearances; and in this consists the principal nicety in the operation. If a various coloured skin rises to the top, which liquefying, runs off to the sides, and is there absorbed by the cupel, visibly staining the parts it enters; if a fresh scoria continually succeeds, and is absorbed nearly as fast as it is formed, only a fine circle of it remaining round the edge of the metal; if the lead appears in gentle motion, and throws up a fume a little way from its surface; the fire is of the proper degree, and the process goes on successfully.

Such a fiery brightness of the cupel as prevents its colour from being distinguished, and the fumes of the lead rising up almost to the arch of the muffle, are marks of too strong a heat: though it must be observed that the elevation of the fumes is not always in proportion to the degree of heat; for if the heat greatly exceeds the due limits, both the fumes and ebullition will entirely cease. In these circumstances the fire must necessarily be diminished: for while the lead boils and smokes vehemently, its fumes are apt to carry off some part of the gold; the cupel is liable to crack from the hasty absorption of the scoria, and part of the gold and silver is divided into globules, which lying discontinued on the cupel after the process is finished, cannot easily be collected: if there is no ebullition or fumes, the scorification does not appear to go on. Too weak a heat is known by the dull redness of the cupel; by the fume not rising from the surface of the lead; and the scoria like bright drops in languid motion, or accumulated, or growing consistent all over the metal. The form of the surface affords also an useful mark of the degree of heat; the stronger the fire, the more convex is the surface, and the weaker, the more flat: in this point, however, regard must be had to the quantity of metal; a large quantity being always flatter than a small one in an equal fire.

Towards the end of the process, the fire must be increased; for, greatest part of the fusible metal lead, being now worked off, the gold and silver will not continue melted in the heat that was sufficient before. As the last remains of the lead are separating, the rainbow colours on the surface become more vivid, and variously intersect one another with quick motions. Soon, after, disappearing all at once, a sudden luminous brightness of the button of gold and silver shews the process to be finished. The cupel is then drawn forwards towards the mouth of the muffle; and the button, as soon as grown fully solid taken out.

CUPELLING FURNACE. See *Cupelling Furnace*.

Cupellation

Cupelling.

Muffle.

Cupid
Cupressus.

CUPID, in pagan mythology, the god of love. There seem to have been two Cupids; the one the son of Jupiter and Venus, whose delight it was to raise sentiments of love and virtue; and the other the son of Mars and the same goddess, who inspired base and impure desires. The first of these, called Eros, bore golden arrows, which caused real joy, and a virtuous affection; the other, called Anteros, had leaden arrows that raised a passion founded only on desire, which ended in satiety and disgust. Cupid was always drawn with wings, to represent his inconstancy; and naked, to shew that he has nothing of his own. He was painted blind, to denote that love sees no fault in the object beloved; and with a bow and quiver of arrows, to shew his power over the mind. Sometimes he is placed between Hercules and Mercury, to shew the prevalence of eloquence and valour in love; and at others is placed near Fortune, to signify that the success of lovers depends on that inconstant goddess. Sometimes he is represented with an helmet on his head, and a spear on his shoulder, to signify that love disarms the fiercest men; he rides upon the backs of panthers and lions, and uses their manes for a bridle, to denote that love tames the most savage beasts. He is likewise pictured riding upon a dolphin, to signify, that his empire extends over the sea, no less than the land.

CUPOLA, in architecture, a spherical vault, or the round top of the dome of a church, in the form of a cup inverted.

CUPPING, in surgery, the operation of applying cupping-glasses for the discharge of blood and other humours by the skin. See **SURGERY**.

CUPRESSUS, the **CYPRESS-TREE**; a genus of the monadelphia order, belonging to the monœcia class of plants. There are six species; the most remarkable are the following: 1. The sempervirens, with an upright straight stem, closely branching all around, almost from the bottom upwards, into numerous quadrangular branches; rising in the different varieties from 15 to 40 or 50 feet in height, and very closely garnished with small, narrow, erect evergreen leaves, placed imbricately; and flowers and fruit from the sides of the branches. 2. The thuyoides, or evergreen American cypress, commonly called white cedar, hath an upright stem, branching out into numerous two-edged branches, rising 20 or 30 feet high, ornamented with flat ever-green leaves imbricated like arbor vitæ, and small blue cones the size of juniper-berries. 3. The disticha, or deciduous American cypress, hath an erect trunk, retaining a large bulk, branching wide and regular; grows 50 or 60 feet high, fully garnished with small, spreading deciduous leaves, arranged distichous, or along two sides of the branches. All these species are raised from seeds, and will sometimes also grow from cuttings; but those raised from seeds prove the handsomest plants. The seeds are procured in their cones from the seedmen, and by exposing them to a moderate heat, they readily open, and discharge the seeds freely. The season for sowing them is any time in March; and they grow freely on a bed or border of common light earth; especially the first and third species. The ground must then be dug, well broken, and raked smooth, then drawing an inch of earth

evenly from off the surface into the alley, sow the seeds moderately thick, and directly sift the earth over them, half an inch deep. If in April and May the weather proves warm and dry, a very moderate watering will now and then be necessary, and the plants will rise in six or eight weeks. During the summer they must be kept clear from weeds, and in dry weather they must be gently watered twice a week. In winter they must be occasionally sheltered with mats in the time of hard frost. In two years they will be fit for transplanting from the seed-bed, when they may be set in nursery-rows two feet asunder; and in three or four years they will be fit for the shrubbery.

The wood of the first species is said to resist worms, moths, and putrefaction, and to last many centuries. The coffins in which the Athenians were wont to bury their heroes were made, says Thucydides, of this wood; as were likewise the chests containing the Egyptian mummies. The doors of St Peter's church at Rome were originally of the same materials. These, after lasting upwards of 600 years, at the end of which they did not discover the smallest tendency to corruption, were removed by order of pope Eugenius IV. and gates of brass substituted in their place. The same tree is by many eminent authors recommended as improving and meliorating the air by its balsamic and aromatic exhalations; upon which account many ancient physicians of the eastern countries used to send their patients who were troubled with weak lungs to the island of Candia, where these trees grew in great abundance; and where, from the salubrious air alone, very few failed of a perfect cure. In the same island, says Miller, the cypress trees were so lucrative a commodity, that the plantations were called *dei filii*; the selling of one of them being reckoned a daughter's portion. Cypress, says Mr Pococke, is the only tree that grows towards the top of mount Lebanon, and being nipped by the cold, grows like a small oak. Noah's ark is commonly supposed to have been made of this kind of wood.

CUPRUM AMMONIACALE. See **CHEMISTRY**, n° 332. This preparation is recommended in some kinds of spasmodic diseases, given in the dose of one or two grains.

CUPRUM, or **COPPER**. See **COPPER**.

CURACOA, or **CURASSOW**, one of the larger Antilles islands, subject to the Dutch; situated in W. Long. 68. 30 N. Lat. 12. 30. This island is little else than a bare rock, about ten leagues long, and five broad; lying three leagues off the coast of Venezuela. It has an excellent harbour, but the entrance is difficult. The basin is extremely large, and convenient in every respect; and is defended by a fort skillfully constructed, and always kept in repair. The reason of forming a settlement upon this barren spot was to carry on a contraband trade with the Spanish colonies on the continent; but after some time the method of managing this trade was changed. Curassow itself became an immense magazine, to which the Spaniards resorted in their boats to exchange gold, silver, vanilla, cocoa, cochineal, bark, skins and mules, for negroes, linen, silks, India stuffs, spices, laces, ribbands, quick-silver, steel, and iron-ware. These voyages, though continual, did not prevent a number of Dutch
sloops

Cupressus
Curacoë.

Curate
|
Curb.

floops from passing from Curassow to the continent. But the modern substitution of register-ships instead of galleons, has made this communication less frequent; but it will be revived whenever, by the intervention of war, the communication with the Spanish main shall be cut off. The disputes between the courts of London and Versailles also prove favourable to the trade of Curassow. At these times it furnishes provisions to the southern parts of St Domingo, and takes off all its produce. Even the French privateers, from the windward islands, repair in great numbers to Curassow, notwithstanding the distance. The reason is, that they find there all kinds of necessary stores for their vessels; and frequently Spanish, but always European goods, which are universally used. English privateers seldom cruise in these parts. Every commodity without exception, that is landed at Curassow, pays one *per cent.* port-duty. Dutch goods are never taxed higher: but those that are shipped from other European ports pay nine *per cent.* more. Foreign coffee is subject to the same tax, in order to promote the sale of that of Surinam. Every other production of America is subject only to a payment of three *per cent.*; but with an express stipulation that they are to be conveyed directly to some port belonging to the republic.

CURATE, the lowest degree in the church of England; he who represents the incumbent of a church, parson or vicar, and officiates divine service in his stead: and in case of pluralities of livings, or where a clergyman is old and infirm, it is requisite there should be a curate to perform the cure of the church. He is to be licensed and admitted by the bishop of the diocese, or by an ordinary having episcopal jurisdiction: and when a curate hath the approbation of the bishop, he usually appoints the salary too; and in such case, if he be not paid, the curate hath a proper remedy in the ecclesiastical court, by a sequestration of the profits of the benefice; but if the curate is not licensed by the bishop, he is put to his remedy at common law, where he must prove the agreement, &c. A curate having no fixed estate in his curacy, not being instituted and inducted, may be removed at pleasure by the bishop or incumbent. But there are perpetual curates as well as temporary, who are appointed where tithes are inappropriate, and no vicarage endowed: these are not removable, and the proprietors are obliged to find them, some whereof have certain portions of the tithes settled on them. Every clergyman that officiates in a church, (whether incumbent or substitute), in the liturgy is called a *curate*. Curates must subscribe the declaration according to the act of uniformity, or are liable to imprisonment, &c.

CURATOR, among civilians, a person regularly appointed to manage the affairs of minors, or persons mad, deaf, dumb, &c. See LAW.

CURB, in the menage, a chain of iron, made fast to the upper part of the branches of the bridle in a hole called the *eye*, and running over the horse's beard. It consists of these three parts; the hook, fixed to the eye of the branch; the chain of SS's or links; and the two rings, or mails. Large curbs, provided they be round, are always most gentle: but care is to be taken, that it rest in its proper place, a little above

the beard, otherwise the bit-mouth will not have the effect that may be expected from it.

English watering bits have no curbs; the Turkish bits, called *genettes*, have a ring that serves instead of a curb. See GENETTES.

CURB, in farriery. See there, § xxviii. 1.

CURCAS, a name given in Egypt to an esculent root, approaching to the taste and virtues of the colocasia. It is also a name used in Malabar for a small fruit of the shape and size of an hazel nut. Both these things have the credit of being strong provocatives; and it is very probable that the curcas of the East Indies may be the fruit called *bel* by Avicenna, and said to possess the same virtues. Garcias has been led into a very great error by this similarity of names and virtues; and supposes the curcas of Egypt the same with that of the East Indies.

CURCULLIO, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are subclavated, and rest upon the snout, which is prominent and horny. There are no less than ninety-five species, principally distinguished by their colour.

CURCUMA, TURMERIC; a genus of the monogynia order, belonging to the monandria class of plants. The species are,

1. The rotunda, with a round root, hath a fleshy-jointed root like that of ginger, but rounder; which sends up several spear-shaped oval leaves, which rise upwards of a foot high, and of a sea-green colour. From between these arises the flower-stalk, supporting a loose spike of flowers of a pale-yellowish colour, inclosed in several different spathe, or sheaths, which drop off. The flowers are never succeeded by seeds in this country. 2. The longa, hath long fleshy roots of a deep yellow colour, which spread under the surface of the ground like those of ginger; they are about the thickness of a man's finger, having many round knotty circles, from which arise four or five large spear-shaped leaves, standing upon long foot-stalks. The flowers grow in loose scaly spikes on the top of the foot-stalks, which arise from the larger knobs of the roots, and grow about a foot high; they are of a yellowish-red colour, and shaped somewhat like those of the Indian reed.

These plants grow naturally in India, from whence the roots are brought to Europe for use. They are very tender; so will not live in this country unless kept constantly in a stove. They are propagated by parting the roots. The root communicates a beautiful but perishable yellow dye, with alum, to woolen, cotton, or linen. In medicine it is esteemed aperient, and emmenagogue; and of singular efficacy in the jaundice.

CURDISTAN, a country of Asia, seated between the Turkish empire and Persia, lying along the eastern coast of the river Tigris, and comprehends great part of the ancient Assyria. Some of the inhabitants live in towns and villages, and others rove from place to place, having tents like the wild Arabs, and are also robbers like them. Their religion is partly Christian, and partly Mahometanism; but they are very loose in regard to either.

CURDLING, the coagulating any fluid body, especially milk.

It is said, that at Florence they curdle their milk
for

for the making of cheese with artichoke-flowers, instead of the rennet used among us for that purpose.

CURETES, in antiquity, a sort of priests, or people, of the isle of Crete; called also *Corybantes*. See *CORYBANTES*, and *CRETE*. The Curetes are said to have been originally of mount Ida, in Phrygia; for which reason they were also called *idæi dactyli*. See *DACTYLI*.

Lucian and Diodorus Siculus represent them as very expert in casting of darts; though other authors give them no weapons but bucklers and pikes: but all agree in furnishing them with tabors, and castanets; and relate that they used to dance much to the noise and clashing thereof. By this noise, it is said they prevented Saturn from hearing the cries of young Jupiter, whereby he was saved from being destroyed.

Some authors, however, give a different account of the Curetes: according to Pezron, and others, the Curetes were, in the times of Saturn, &c. and in the countries of Crete and Phrygia, what the druids were afterwards among the Gauls, &c. i. e. they were priests who had the care of what related to religion, and the worship of the gods.

Hence, as in those days it was supposed there was no communication with the gods but by divinations, auguries, and the operations of magic; the Curetes passed for magicians and enchanters: to these they added the study of the stars, of nature, and poetry; and so were philosophers, astronomers, &c.

Vossius, *de Idolat.* distinguishes three kinds of Curetes; those of Ætolia, those of Phrygia, and those of Crete who were originally derived from the Phrygians. The first, he says, took their name from *κρηται*, *tonsure*; in regard, from the time of a combat wherein the enemy seized their long hair, they always kept it cut: those of Phrygia and Crete, he supposes, were so called from *κρηται*, *young man*; in regard they were young, or because they nursed Jupiter when he was young.

CURFEW, or **COURFEW**, a signal given in cities taken in war, &c. to the inhabitants to go to bed. Pasquin says, it was so called, as being intended to advertise the people to secure themselves from the robberies and debaucheries of the night.

The most eminent curfew in England was that established by William the Conqueror, who appointed, under severe penalties, that, at the ringing of a bell at eight o'clock in the evening, every one should put out their lights and fires, and go to bed: whence, to this day, a bell rung about that time is called a *curfew-bell*.

CURIA, in Roman antiquity, was used for the senate-house. There were several curiæ in Rome; as the *curia calabra* said to be built by Romulus, the *curia hostilia* by Tullus Hostilius, and the *curia pompeia* by Pompey the Great.

CURIA, also denoted the places where the curiæ used to assemble. Each of the 30 curiæ of old Rome had a temple or chapel assigned to them for the common performance of their sacrifices, and other offices of their religion; so that they were not unlike our parishes. Some remains of these little temples seem to have subsisted many ages after on the Palatine hill,

where Romulus first built the city, and always resided.

CURIA, among the Romans, also denoted a portion, or division of a tribe. In the time of Romulus, a tribe consisted of ten curiæ, or a thousand men; each curia being one hundred: that legislator made the first division of his people into thirty curiæ. Afterwards, *curia*, or *domus curialis*, became used for the place where each curia held its assemblies. Hence, also, curia passed to the senate-house; and it is from hence the moderns come to use the word *curia*, court, for a place of justice, and for the judges, &c. there assembled.

CURIA, in our ancient customs.—It was usual for the kings of England to summons the bishops, peers, and great men of the kingdom, to some particular place, at the chief festivals in the year: and this assembly is called, by our historians, *curia*; because there they consulted about the weighty affairs of the nation: whence it was sometimes also called, *solemnis curia*, *generalis curia*, *augustalis curia*, and *curia publica*, &c. See *WITENA-MOT*.

CURIA Baronum. See *COURT-Baron*.

CURIA Claudenda, is a writ that lies against him who should fence and enclose the ground, but refuses or defers to do it.

CURIATII, three brothers of Alba, maintained the interest of their country against the Romans who had declared war against those of Alba. The two armies being equal, three brothers on each side were chosen to decide the contest: the Curiatii by those of Alba, and the Horatii by the Romans. The three first were wounded, and two of the latter killed: but the third, joining policy to valour, ran away; and having thus tired the curiatii, he took them one after another and killed them all three.

CURING, a term used for the preserving fish, flesh, and other animal substances, by means of certain additions of things, to prevent putrefaction. One great method of doing this, is by smoking the bodies with the smoke of wood, or rubbing them with salt, nitre, &c.

CURLEW, in ornithology. See *SCOLOPAX*.

CURNOCK, a measure of corn, containing four bushels, or half a quarter.

CURMI, a name given by the ancients to a sort of malt liquor or ale. It was made of barley, and was drunk by the people of many nations instead of wine, according to Dioscorides's account: he accuses it of causing pains in the head, generating bad juices, and disordering the nervous system. He also says, that in the western part of Iberia, and in Britain, such a sort of liquor was in his time prepared from wheat instead of barley. See *ALE*.

CURRANS, or **CURRENTS**, the fruit of a species of grossularia. See *GROSSULARIA*.

The white and red sort are mostly used; for the black, and chiefly the leaves, upon first coming out, are in use to flavour English spirits, and counterfeit French brandy. Currants greatly assuage drought, cool, and fortify the stomach, and help digestion; and the jelly of black currants is said to be very efficacious in curing inflammations of the throat.

CURRENTS, also signify a smaller kind of grapes, brought

Curia
Currants.

current.

brought principally from Zant and Cephalonia. They are gathered off the buffies, and laid to dry in the sun, and to put up in large butts. They are opening and pectoral; but are more used in the kitchen, than in medicine.

CURRENT, in navigation, a certain progressive movement of the water of the sea, by which all bodies floating therein are compelled to alter their course, or velocity, or both, and submit to the laws imposed on them by the current.

In the sea, currents are either natural and general, as arising from the diurnal rotation of the earth about its axis; or accidental and particular, caused by the waters being driven against promontories, or into gulphs and straits, where, wanting room to spread, they are driven back, and thus disturb the ordinary flux of the sea. Currents are various, and directed towards different parts of the ocean, of which some are constant, other periodical. The most extraordinary current of the sea, is that by which part of the Atlantic or African ocean moves about Guinea from Cape Verd towards the Curvature or bay of Africa, which they call *Fernando Poo*; viz. from west to east, contrary to the general motion. And such is the force of the current, that when ships approach too near the shore, it carries them violently towards that bay, and deceives the mariners in their reckoning. There is a great variety of shifting currents which do not last, but return at certain periods; and these do, most of them, depend upon and follow the anniverary winds or monsoons, which by blowing in one place may cause a current in another. Varenus informs us, that at Java, in the streights of Sunda, when the monsoons blow from the west, viz. in the month of May, the currents set to the eastward, contrary to the general motion. Between the island of Celebes and Madura, when the western monsoons set in, viz. in December, January, and February, or when the winds blow from the north-west, or between the north and west, the currents set to the south-east, or between the south and east. At Ceylon, from the middle of March to October, the currents set to the southward, and in the other parts of the year to the northward: because at this time the southern monsoons blow, and at the other the northern. Between Cochín China and Malacca, when the western monsoons blow, viz. from April to August, the currents set eastward against the general motion; but the rest of the year they set westward; the monsoon conspiring with the general motion. They run so strongly in these seas, that unexperienced sailors mistake them for waves that beat upon the rocks, known usually by the name of *breakers*. So for some months after the 15th of February, the currents set from the Maldives towards India on the east, against the general motion of the sea. On the shore of China and Cambodia, in the months of October, November, and December, the currents set to the north-west, and from January to the south-west, when they run with such rapidity about the shoals of Parcel, that they seem swifter than an arrow. At Pulo Condore, upon the coast of Cambodia, though the monsoons are shifting, yet the currents set strongly towards the east, even when they blow to a contrary point. Along the coasts

of the bay of Bengal, as far as the Cape Romania, at the extreme point of Malacca, the current runs southward in November and December. When the monsoons blow from China to Malacca, the sea runs swiftly from Pulo Cambi to Pulo Condore on the coast of Cambodia. In the bay of Sans Bras, not far from the Cape of Good Hope, there is a current particularly remarkable, where the sea runs from east to west to the landward; and this more vehemently as it is opposed by winds from a contrary direction. The cause is undoubtedly owing to some adjacent shore which is higher than this. In the straits of Gibraltar, the currents almost constantly drive to the eastward, and carry ships into the Mediterranean: they are also found to drive the same way into St George's channel.

The setting or progressive motion of the current may be either quite down to the bottom, or to a certain determinate depth. As the knowledge of the direction and velocity of currents is a very material article in navigation, it is highly necessary to discover both, in order to ascertain the ship's situation and course with as much accuracy as possible. The most successful method which has been hitherto practised by mariners for this purpose is as follows. A common iron pot, which may contain four or five gallons, is suspended by a small rope fastened to its ears or handles, so as to hang directly upright, as when placed upon the fire. This rope, which may be from 70 to 100 fathoms in length, being prepared for the experiment, is coiled in the boat, which is hoisted out of the ship at a proper opportunity, when there is little or no wind to ruffle the surface of the sea. The pot being then thrown overboard into the water, and immediately sinking, the line is slackened till about 70 or 80 fathoms of the line run out; after which the line is fastened to the boat's stern, by which she is accordingly restrained, and rides as at anchor. The velocity of the current is then easily tried by the *log* and half-minute glass, the usual method of discovering the rate of a ship's sailing at sea. The course of the stream is next obtained by the compass provided for this operation. Having thus found the setting and drift of the current, it next remains to apply this experiment to the purposes of navigation; for which see **NAVIGATION**, sect. vi.

CURRIERS, those who dress and colour leather after it comes from the tan-yard. See **TANNING**.

CURRYING, the method of preparing leather with oil, tallow, &c.

The chief business is to soften and supple cow and calve-skins, which make the upper-leathers and quarters of shoes, covering of saddles, coaches, and other things which must keep out water. 1. These skins, after coming from the tanner's yard*, having many fleshy fibres on them, the currier soaks them some time in common water. 2. He takes them out and stretches them on a very even wooden horse; then with a paring-knife, he scrapes off all the superfluous flesh, and puts them in to soak again. 3. He puts them wet on a hurdle, and tramples them with his heels, till they begin to grow soft and pliant. 4. He soaks thereon train-oil, which by its unctuous quality is the best liquor for this purpose. 5. He spreads them on large tables, and fastens them at the ends. There, with

Curriers
Currying.

* See *Tanning*.

Curling
||
Curtece.

with the help of an instrument called a *pummel*, which is a thick piece of wood, the under-side of which is full of furrows crossing each other, he folds, squares, and moves them forwards and backwards several times, under the teeth of this instrument, which breaks their too great stiffness. This is what is properly called *currying*. The order and number of these operations is varied by different curriers, but the material part is always the same. 6. After the skins are curried, there may be occasion to colour them. The colours are black, white, red, yellow, green, &c., the other colours are given by the skinners, who differ from curriers in this, that they apply their colours on the flesh-side; the curriers on the hair side. In order to whiten skins, they are rubbed with lumps of chalk, or white lead, and afterwards with pumice-stone. 7. When a skin is to be made black, after having oiled and dried it, he passes over it a puff dipt in water impregnated with iron; and after his first wetting, he gives it another in a water prepared with foot, vinegar, and gum-arabic. These different dyes gradually turn the skin black, and the operations are repeated till it be of a shining black. The grain and wrinkles which contribute to the suppleness of calves and cows leather, are made by the reiterated folds given to the skin in every direction, and by the care taken to scrape off all hard parts on the colour-side.

CURSING AND SWEARING; an offence against God and religion, and a sin of all others the most extravagant and unaccountable, as having no benefit or advantage attending it. By the last statute against this crime, 19 Geo. II. which repeals all former ones, every labourer, sailor, or soldier, profanely cursing or swearing, shall forfeit 1s.; every other person under the rank of a gentleman, 2s.; and every gentleman or person of superior rank, 5s. to the poor of the parish; and, on a second conviction, double; and, for every subsequent offence, treble the sum first forfeited, with all charges of conviction; and, in default of payment, shall be sent to the house of correction for 10 days. Any justice of the peace may convict upon his own hearing, or the testimony of one witness; and any constable, or peace-officer, upon his own hearing, may secure any offender and carry him before a justice, and there convict him. If the justice omits his duty, he forfeits 5l. and the constable 40s. And the act is to be read in all parish-churches and public chapels, the Sunday after every quarter-day, on pain of 5l. to be levied by warrant from any justice. Besides this punishment for taking God's name in vain in common discourse, it is enacted, by stat. 3 Jac. I. c. 21. that if in any stage-play, interlude, or show, the name of the holy Trinity, or any of the persons therein, be jestingly or profanely used, the offender shall forfeit 10l.; one moiety to the king, and the other to the informer.

CURSITOR, a clerk belonging to the court of chancery, whose business it is to make out original writs. In the statute 18 Edw. III. they are called *clerks of course*, and are 24 in number, making a corporation of themselves. To each of them is allowed a division of certain counties, into which they issue out the original writs required by the subject.

CURTATE DISTANCE, in astronomy, the distance of a planet from the sun to that point, where a per-

pendicular let fall from the planet meets with the ecliptic.

CURTATION, in astronomy, is the interval between a planet's distance from the sun, and the curteate distance.

CURTEYN, *curtana*, was the name of Edward the confessor's sword, which is the first sword carried before the kings of England at their coronation; and it is said the point of it is broken as an emblem of mercy.

CURTIN, *CURTAIN*, or *Courtin*, in fortification, is that part of the rampart of a place which is betwixt the flanks of two bastions, bordered with a parapet five feet high, behind which the soldiers stand to fire upon the covered way and into the moat.

CURTIUS (Quintus), a Roman gentleman *an. Rom.* 392. Understanding by the oracle, that a certain gulf in the forum, which boded misfortune to the city, could only be stopped by throwing the most precious thing they had into it; Curtius, considering of it, thought his own merit above all others, and leaped into the abyss, which (it is said) suddenly closed up.

CURTIUS (Quintus), a Latin historian who wrote the Life of Alexander the Great in 10 books, of which the two first are not indeed extant, but are so well supplied by Freinshemius, that the loss is scarcely regretted. Where this writer was born, or even when he lived, are points no one pretends to know: by his style he is supposed to have lived in or near the Augustan age; while some are not wanting, who imagine the work to have been composed in Italy about 300 years ago, and the name of *Quintus Curtius* to be fictitiously added to it. Cardinal du Perron was so great an admirer of this work, as to declare one page of it to be worth 30 of Tacitus; yet M. le Clerc, at the end of his Art of Criticism, has charged the writer with great ignorance, and many contradictions.

CURVATURE of a LINE, is the peculiar manner of its bending or flexure, by which it becomes a curve of such and such peculiar properties.

CURVE, in geometry, a line which running on continually in all directions, may be cut by one right line in more points than one. See CONIC SECTIONS, and FLUCTIONS.

CURVET, or **CORVET**, in the menage, an air in which the horse's legs are raised higher than in the demi volt; being a kind of leap up, and a little forwards, wherein the horse raises both his fore-legs at once, equally advanced, (when he is going straight forward, and not in a circle), and as his fore-legs are falling, he immediately raises his hind-legs, equally advanced, and not one before the other: so that all his four legs are in the air at once; and as he sets them down, he marks but twice with them.

CURVILINEAR, or **CURVILINEAL**, is said of figures bounded by curves, or crooked lines.

CURVIROSTRA, in ornithology. See LOXIA.

CURULE CHAIR, in Roman antiquity, a chair adorned with ivory, wherein the great magistrates of Rome had a right to sit and be carried.

The curule magistrates were the ædiles, the prætors, censors, and consuls. This chair was fitted in a kind of chariot, whence it had its name. The senators who had borne the offices of ædiles, prætors, &c. were carried to the senate-house in this chair, as were
also

|
Curule.

Curzola
Cuscuta.

also those who triumphed, and such as went to administer justice, &c. See *ÆDILE*, &c.

CURZOLA, an island in the gulph of Venice, lying on the coast of Dalmatia: it is about 20 miles long, and has a small town of the same name, with a bishop's see. It belongs to the Venetians. E. Long. 17. 15. N. Lat. 43. 6.

CUSA (Nicholas de), a learned cardinal, born of mean parentage, and named from Cusa, the place of his birth. He was made a cardinal in 1448; and being appointed governor of Rome by pope Pius II. during his absence at Mantua, he was the chief concertor and manager of the war against the Turks. He founded a church, and a noble library of Greek and Latin authors, at Cusa; and left many excellent works behind him, which were collected and published in three volumes at Basil in 1565. In these he has made no scruple to detect the lying traditions and fophs of the Roman church.

CUSCO, a large and handsome town of South America, in Peru, formerly the residence of the Incas. It is seated at the foot of a mountain, and is built in a square form, in the middle of which there is the best market in all America: four large streets terminate in this square, which are all as straight as a line, and regard the four quarters of the world. The Spaniards tell us wonderful things of the richness of the Inca's palace, and of the temple of the sun; but more sober travellers, judging from what remains, think most of them to be fabulous. At present it contains eight large parishes, and five religious houses, the best of which belongs to the Jesuits; and the number of the inhabitants may be about 50,000, of which 3-4^{ths} are the original natives, Americans. From this town there is a very long road, which runs along the Cordeleim; and, at certain distances, there are small houses for resting-places, some parts of which are so artificially wrought, that it is surprizing how a people, who had no iron tools, could perform such workmanship. There are streams of water run through the town, which are a great convenience in so hot a country, where it never rains. It is 375 miles east of Lima. W. Long. 74. 37. S. Lat. 13. 0.

CUSCUTA, **DODDER**; a genus of the digynia order, belonging to the triandria class of plants. There are two species; one of which is a native of Britain, viz. the Europeæ, dodder, hell-weed, or devil's-guts. This is a very singular plant, almost destitute of leaves, parasitical, creeping, fixing itself to whatever is next to it. It decays at the root, and afterwards is nourished by the plant which supports it. Hops, flax, and nettles, are its common support; but principally the common nettle. Its blossoms are white. As soon as the shoots have twined about an adjacent plant, they send out from their inner surface a number of little vesicles or papillæ, which attach themselves to the bark or rind of the plant. By degrees the longitudinal vessels of the stalk, which appear to have accompanied the vesicles, shoot from their extremities, and make their way into the foster plant, by dividing the vessels and insinuating themselves into the tenderest part of the stalk; and so intimately are they united with it, that it is easier to break than to disengage them from it. The whole plant is bitter. It affords

a pale reddish colour. Cows, sheep, and swine, eat it; horses refuse it; goats are not fond of it.

CUSPIDATED, in botany, are such plants whose leaves are pointed like a spear.

CUSTOM, a very comprehensive term, denoting the manners, ceremonies, and fashions, of a people, which having turned into a habit, and passed into use, obtain the force of laws; in which sense it implies such usages, as, though voluntary at first, are yet by practice become necessary.

Custom is hence, both by lawyers and civilians, defined *lex non scripta*, "a law or right not written," established by long usage, and the consent of our ancestors: in which sense it stands opposed to the *lex scripta*, or "the written law." See *LAW*, Part II. n^o 38.—41.

CUSTOM and HABIT, in the human œconomy. The former is often confounded with the latter. By *custom* we mean a frequent reiteration of the same act; and by *habit*, the effect that custom has on the mind or body. This curious subject falls to be considered first in a moral, and secondly in a physical, light.

1. *Influence of Custom and Habit on the Mind, &c.* Custom hath such influence upon many of our feelings, by warping and varying them, that its operations demand the attention of all who would be acquainted with human nature. The subject, however, is intricate. Some pleasures are fortified by custom; and yet custom begets familiarity, and consequently indifference:

[If all the year were playing holidays,
To sport would be as tedious as to work:
But when they seldom come, they wish'd for come,
And nothing pleaseth, but rare accidents.]

Shakesp.

In many instances, satiety and disgust are the consequences of reiteration: again, though custom blunts the edge of distress and of pain; yet the want of any thing to which we have been long accustomed is a sort of torture. A clue to guide us through all the intricacies of this labyrinth, would be an acceptable present.

Whatever be the cause, it is certain that we are much influenced by custom: it hath an effect upon our pleasures, upon our actions, and even upon our thoughts and sentiments. Habit makes no figure during the vivacity of youth: in middle age it gains ground; and in old age governs without control. In that period of life, generally speaking, we eat at a certain hour, take exercise at a certain hour, go to rest at a certain hour, all by the direction of habit: nay, a particular seat, table, bed, comes to be essential; and a habit in any of these cannot be controlled without uneasiness.

Any slight or moderate pleasure, frequently reiterated for a long time, forms a peculiar connection between us and the thing that causes the pleasure. This connection, termed *habit*, has the effect to awaken our desire or appetite for that thing when it returns not as usual. During the course of enjoyment, the pleasure rises insensibly higher and higher till a habit be established; at which time the pleasure is at its height. It continues not, however, stationary: the same cu-

Cuspidated
Custom and
habit.

stomary reiteration which carried it to its height, brings it down again by insensible degrees, even lower than it was at first; but of that circumstance afterward. What at present we have in view, is to prove by experiments, that those things which at first are but moderately agreeable, are the aptest to become habitual. Spirituous liquors, at first scarce agreeable, readily produce an habitual appetite: and custom prevails so far, as even to make us fond of things originally disagreeable, such as coffee, *assa-fetida*, and tobacco.

A walk upon the quarter-deck, though intolerably confined, becomes however so agreeable by custom, that a sailor in his walk on shore confines himself commonly within the same bounds. The author knew a man who had relinquished the sea for a country-life: in the corner of his garden he reared an artificial mount with a level summit, resembling most accurately a quarter-deck, not only in shape but in size; and here he generally walked. In Minorca governor Kane made an excellent road the whole length of the island; and yet the inhabitants adhere to the old road, though not only longer but extremely bad. Play or gaming, at first barely amusing by the occupation it affords, becomes in time extremely agreeable; and is frequently prosecuted with avidity, as if it were the chief business of life. The same observation is applicable to the pleasures of the internal senses, those of knowledge and virtue in particular: children have scarce any sense of these pleasures; and men very little who are in the state of nature without culture: our taste for virtue and knowledge improves slowly; but is capable of growing stronger than any other appetite in human nature.

To introduce an active habit, frequency of acts is not sufficient without length of time: the quickest succession of acts in a short-time, is not sufficient; nor a slow succession in the longest time. The effect must be produced by a moderate swift action, and a long series of easy touches, removed from each other by short intervals. Nor are these sufficient without regularity in the time, place, and other circumstances of the action: the more uniform any operation is, the sooner it becomes habitual. And this holds equally in a passive habit; variety in any remarkable degree, prevents the effect: thus any particular food will scarce ever become habitual, where the manner of dressing is varied. The circumstances then requisite to augment a moderate pleasure, and at the long-run to form a habit, are weak uniform acts, reiterated du-

ring a long course of time, without any considerable interruption: every agreeable cause that operates in this manner, will grow habitual.

Affection and aversion, as distinguished from passion on the one hand, and on the other from original disposition, are in reality habits respecting particular objects, acquired in the manner above set forth. The pleasure of social intercourse with any person, must originally be faint, and frequently reiterated, in order to establish the habit of affection. Affection thus generated, whether it be friendship or love, seldom swells into any tumultuous or vigorous passion; but is however the strongest cement that can bind together two individuals of the human species. In like manner, a slight degree of disgust often reiterated with regularity, grows into the habit of aversion, which commonly subsists for life.

Objects of taste that are delicious, far from tending to become habitual, are apt by indulgence to produce satiety and disgust: no man contracts a habit of sugar, honey, or sweet-meats, as he doth of tobacco.

These violent delights have violent ends,
In their triumph die. The sweetest honey
Is loathsome in its own deliciousness,
And in the taste confounds the appetite;
Therefore love moderately, long love doth so;
Too swift arrives as tardy as too slow.

Romeo and Juliet, act 2. sc. 6.

The same observation holds with respect to all objects that being extremely agreeable raise violent passions: such passions are incompatible with a habit of any sort; and in particular they never produce affection nor aversion: a man who at first sight falls violently in love, has a strong desire of enjoyment, but no affection for the woman (A): a man who is surprised with an unexpected favour, burns for an opportunity to exert his gratitude, without having any affection for his benefactor: neither does desire of vengeance for an atrocious injury, involve aversion.

It is perhaps not easy to say why moderate pleasures gather strength by custom: but two causes concur to prevent that effect in the more intense pleasures. These, by an original law in our nature, increase quickly to their full growth, and decay with no less precipitation*; and custom is too slow in its operation to overcome that law. The other cause is not less powerful: exquisite pleasure is extremely fatiguing; occasioning, as a naturalist would say, great expense of animal spirits; and of such the mind cannot

* See EMOTION and
Passions,
n^o ix.

(A) Violent love without affection is finely exemplified in the following story. When Constantine was taken by the Turks, Irene, a young Greek of an illustrious family, fell into the hands of Mahomet II. who was at that time in the prime of youth and glory. His savage heart being subdued by her charms, he shut himself up with her, denying access even to his ministers. Love obtained such ascendancy as to make him frequently abandon the army, and fly to his Irene. War relaxed, for victory was no longer the monarch's favourite passion. The soldiers, accustomed to booty, began to murmur, and the infection spread even among the commanders. The Basha Mustafa, consulting the fidelity he owed his master, was the first who durst acquaint him of the discourses held publicly to the prejudice of his glory.

The Sultan, after a gloomy silence, formed his resolution. He ordered Mustafa to assemble the troops next morning; and then with precipitation retired to Irene's apartment. Never before did that prince appear so charming; never before did the prince bestow so many warm caresses. To give a new lustre to her beauty, he exhorted her women next morning to bestow their utmost art and care on her dress. He took her by the hand, led her into the middle of the army, and pulling off her veil, demanded of the basbas with a fierce look, whether they had ever beheld such a beauty? After an awful pause, Mahomet with one hand laying hold of the young Greek by her beautiful locks, and with the other pulling out his scimitar, severed the head from the body at one stroke. Then turning to his grandees, with eyes wild and furious, "This sword," says he, "when it is my will, knows as to cut the bands of love." However strange it may appear, we learn from experience, that desire of enjoyment may confound with the most brutal aversion, directed both to the same woman. Of this we have a noted example in the first book of Sully's *Memoirs*; to which we chuse to refer the reader, for it is too gross to be transcribed.

Custom and habit.

Custom and habit.

not bear so frequent gratification, as to superinduce a habit: if the thing that raises the pleasure return before the mind have recovered its tone and relish, disgust ensues instead of pleasure.

A habit never fails to admonish us of the wonted time of gratification, by raising a pain for want of the object, and a desire to have it. The pain of want is always first felt: the desire naturally follows; and upon presenting the object, both vanish instantaneously. Thus a man accustomed to tobacco, feels, at the end of the usual interval, a confused pain of want, which at first points at nothing in particular, though it soon settles upon its accustomed object: and the same may be observed in persons addicted to drinking, who are often in an uneasy restless state before they think of the bottle. In pleasures indulged regularly, and at equal intervals, the appetite, remarkably obsequious to custom, returns regularly with the usual time of gratification; not sooner, even though the object be presented. This pain of want arising from habit, seems directly opposite to that of satiety; and it must appear singular, that frequency of gratification should produce effects so opposite, as are the pains of excess and of want.

The appetites that respect the preservation and propagation of our species, are attended with a pain of want similar to that occasioned by habit: hunger and thirst are uneasy sensations of want, which always precede the desire of eating or drinking; and a pain for want of carnal enjoyment, precedes the desire of an object. The pain being thus felt independent of an object, cannot be cured but by gratification. Very different is an ordinary passion, in which desire precedes the pain of want: such a passion cannot exist but while the object is in view; and therefore, by removing the object out of thought, it vanisheth with its desire and pain of want*.

The natural appetites above mentioned, differ from habit in the following particular: they have an undetermined direction toward all objects of gratification in general; whereas an habitual appetite is directed to a particular object: the attachment we have by habit to a particular woman, differs widely from the natural passion which comprehends the whole sex; and the habitual relish for a particular dish, is far from being the same with a vague appetite for food. That difference notwithstanding, it is still remarkable, that nature hath enforced the gratification of certain natural appetites essential to the species, by a pain of the same sort with that which habit produceth.

The pain of habit is less under our power than any other pain that arises from want of gratification: hunger and thirst are more easily endured, especially at first, than an unusual intermission of any habitual pleasure: persons are often heard declaring, they would forego sleep or food, rather than tobacco. We must not however conclude, that the gratification of an habitual appetite affords the same delight with the gratification of one that is natural: far from it; the pain of want only, is greater.

The slow and reiterated acts that produce a habit, strengthen the mind to enjoy the habitual pleasure in greater quantity and more frequently than originally; and by that means a habit of intemperate gratification

is often formed: are without unbounded acts of intemperance, the habitual relish is soon restored, and the pain for want of enjoyment returns with fresh vigour.

The causes of the present emotions hitherto in view, are either an individual, such as a companion, a certain dwelling-place, a certain amusement; or a particular species, such as coffee, mutton, or any other food. But habit is not confined to such. A constant train of trifling diversions, may form such a habit in the mind, that it cannot be ealy a moment without amusement: a variety in the objects prevents a habit as to any one in particular; but as the train is uniform with respect to amusement, the habit is formed accordingly; and that sort of habit may be denominated a *generic habit*, in opposition to the former, which is a *specific habit*. A habit of a town-life, of country-sports, of solitude, of reading, or of business, where sufficiently varied, are instances of generic habits. Every specific habit hath a mixture of the generic; for the habit of any one sort of food makes the taste agreeable, and we are fond of that taste wherever found. Thus a man deprived of an habitual object, takes up with what most resembles it; deprived of tobacco, any bitter herb will do, rather than want: a habit of punch, makes wine a good resource: accustomed to the sweet society and comforts of matrimony, the man unhappily deprived of his beloved object, inclines the sooner to a second. In general, when we are deprived of a habitual object, we are fond of its qualities in any other object.

The reasons are assigned above, why the causes of intense pleasure become not readily habitual: but now we discover, that these reasons conclude only against specific habits. In the case of a weak pleasure, a habit is formed by frequency and uniformity of reiteration, which, in the case of an intense pleasure, produceth satiety and disgust. But it is remarkable, that satiety and disgust have no effect, except as to that thing singly which occasions them: a surfeit of honey produceth not a loathing of sugar; and intemperance with one woman produceth no disselish of the same pleasure with others. Hence it is easy to account for a generic habit in any intense pleasure: the delight we had in the gratification of the appetite, enflames the imagination, and makes us, with avidity, search for the same gratification in whatever other object it can be found. And thus uniform frequency in gratifying the same passion upon different objects, produceth at length a generic habit. In this manner, one acquires an habitual delight in high and poignant sauces, rich dress, fine equipages, crowds of company, and in whatever is commonly termed *pleasure*. There concurs at the same time, to introduce this habit, a peculiarity observed above, that reiteration of acts enlarges the capacity of the mind, to admit a more plentiful gratification than originally, with regard to frequency as well as quantity.

Hence it appears, that though a specific habit cannot be formed but upon a moderate pleasure, a generic habit may be formed upon any sort of pleasure, moderate or immoderate, that hath variety of objects. The only difference is, that a weak pleasure runs naturally into a specific habit; whereas an intense pleasure is altogether averse to such a habit. In a word,

Custom and
habit.

it is only in singular cases that a moderate pleasure produces a generic habit; but an intense pleasure cannot produce any other habit.

The appetites that respect the preservation and propagation of the species, are formed into habit in a peculiar manner; the time as well as measure of their gratification are much, under the power of custom; which, introducing a change upon the body, occasions a proportional change in the appetites. Thus, if the body be gradually formed to a certain quantity of food at stated times, the appetite is regulated accordingly; and the appetite is again changed, when a different habit of body is introduced by a different practice. Here it would seem, that the change is not made upon the mind, which is commonly the case in passive habits, but upon the body.

When rich food is brought down by ingredients of a plainer taste, the composition is susceptible of a specific habit. Thus the sweet taste of sugar, rendered less poignant in a mixture, may, in course of time, produce a specific habit for such mixture. As moderate pleasures, by becoming more intense, tend to generic habits; so intense pleasures, by becoming more moderate, tend to specific habits.

The beauty of the human figure, by a special recommendation of nature, appears to us supreme, amid the great variety of beautiful forms bestowed upon animals. The various degrees in which individuals enjoy that property, render it an object, sometimes of a moderate, sometimes of an intense passion. The moderate passion, admitting frequent reiteration without diminution, and occupying the mind without exhausting it, turns gradually stronger till it becomes a habit. Nay, instances are not wanting, of a face at first disagreeable, afterward rendered indifferent by familiarity, and at length agreeable by custom. On the other hand, consummate beauty, at the very first glance, fills the mind so as to admit no increase. Enjoyment lessens the pleasure*; and if often repeated, ends commonly in satiety and disgust. The impressions made by consummate beauty, in a gradual succession from lively to faint, constitute a series opposite to that of faint impressions waxing gradually more lively, till they produce a specific habit. But the mind, when accustomed to beauty, contracts a relish for it in general, though often repelled from particular objects by the pain of satiety; and thus a generic habit is formed, of which inconstancy in love is the necessary consequence; for a generic habit, comprehending every beautiful object, is an invincible obstruction to a specific habit, which is confined to one.

But a matter which is of great importance to the youth of both sexes, deserves more than a cursory view. Though the pleasant emotion of beauty differs widely from the corporeal appetite, yet when both are directed to the same object, they produce a very strong complex passion*: enjoyment in that case must be exquisite; and therefore more apt to produce satiety than in any other case whatever. This is a never-failing effect, where consummate beauty in the one party, meets with a warm imagination and great sensibility in the other. What we are here explaining, is true without exaggeration; and they must be insensible upon whom it makes no impression: it de-

Custom and
habit.

erves well to be pondered by the young and the amorous, who, in forming the matrimonial society, are too often blindly impelled by the animal pleasure merely, enflamed by beauty. It may indeed happen after the pleasure is gone, and go it must with a swift pace, that a new connection is formed upon more dignified and more lasting principles: but this is a dangerous experiment; for even supposing good sense, good temper, and internal merit of every sort, yet a new connection upon such qualifications is rarely formed: it commonly, or rather always happens, that such qualifications, the only solid foundation of an indissoluble connection, are rendered altogether invisible by satiety of enjoyment creating disgust.

One effect of custom, different from any that have been explained, must not be omitted, because it makes a great figure in human nature: though custom augments moderate pleasures, and lessens those that are intense, it has a different effect with respect to pain; for it blunts the edge of every sort of pain and distress, faint or acute. Uninterrupted misery, therefore, is attended with one good effect: if its torments be incessant, custom hardens us to bear them.

The changes made in forming habits, are curious. Moderate pleasures are augmented gradually by reiteration, till they become habitual; and then are at their height: but they are not long stationary; for from that point they gradually decay, till they vanish altogether. The pain occasioned by want of gratification, runs a different course: it increases uniformly; and at last becomes extreme, when the pleasure of gratification is reduced to nothing.

———It so falls out,

That what we have we prize not to the worth,
While we enjoy it; but being lack'd and lost,
Why then we rack the value; and then find
The virtue that possession would not show us
Whilst it was ours.

Much ado about nothing, act 4. sc. 2.

The effect of custom with relation to a specific habit, is displayed through all its varieties in the use of tobacco. The taste of that plant is at first extremely unpleasant: our disgust lessens gradually, till it vanishes altogether; at which period the taste is neither agreeable nor disagreeable: continuing the use of the plant, we begin to relish it; and our relish improves by use, till it arrive at perfection: from that period it gradually decays, while the habit is in a state of increment, and consequently the pain of want. The result is, that when the habit has acquired its greatest vigour, the relish is gone; and accordingly we often smoke and take snuff habitually, without so much as being conscious of the operation. We must except gratification after the pain of want; the pleasure of which gratification is the greatest when the habit is the most vigorous: it is of the same kind with the pleasure one feels upon being delivered from the rack, the cause of which is explained elsewhere*. This pleasure however is but occasionally the effect of habit; and however exquisite, is avoided as much as possible because of the pain that precedes it.

With regard to the pain of want, we can discover no difference between a generic and a specific habit; but

TIONS and
Passions,
n^o iii.

Story and but these habits differ widely with respect to the positive pleasure. We have had occasion to observe, that the pleasure of a specific habit decays gradually till it turn imperceptible: the pleasure of a generic habit on the contrary, being supported by variety of gratification, suffers little or no decay after it comes to its height. However it may be with other generic habits, the observation certainly holds with respect to the pleasures of virtue and of knowledge: the pleasure of doing good has an unbounded scope, and may be so variously gratified that it can never decay; science is equally unbounded; our appetite for knowledge having an ample range of gratification; where discoveries are recommended by novelty, by variety, by utility, or by all of them.

In this intricate enquiry, we have endeavoured, but without success, to discover by what particular means it is that custom hath influence upon us; and now nothing seems left, but to hold our nature to be so framed as to be susceptible of such influence. And supposing it purposely so framed, it will not be difficult to find out several important final causes. That the power of custom is a happy contrivance for our good, cannot have escaped any one who reflects, that business is our province, and pleasure our relaxation only. Now satiety is necessary to check exquisite pleasures, which otherwise would engross the mind and unqualify us for business. On the other hand, as business is sometimes painful, and is never pleasant beyond moderation, the habitual increase of moderate pleasure, and the conversion of pain into pleasure, are admirably contrived for disappointing the malice of Fortune, and for reconciling us to whatever course of life may be our lot:

How else doth breed a habit in a man!
This shadowy desert, unfrequented woods,
I better brook than flourishing peopled towns.
Here I can sit alone, unseen of any,
And to the nightingale's complaining notes
Tune my distresses, and record my woes.

Two Gentlemen of Verona, act 5. sc. 4.

As the foregoing distinction between intense and moderate, hold in pleasure only, every degree of pain being softened by time, custom is a catholicon for pain and distress of every sort; and of that regulation the final cause requires no illustration.

Another final cause of custom will be highly relished by every person of humanity, and yet has in a great measure been overlooked; which is, that custom hath a greater influence than any other known cause, to put the rich and the poor upon a level: weak pleasures, the share of the latter, become fortunately stronger by custom; while voluptuous pleasures, the share of the former, are continually losing ground by satiety. Men of fortune, who possess palaces, sumptuous gardens, rich fields, enjoy them less than passengers do. The goods of Fortune are not unequally distributed: the opulent profits what others enjoy.

And indeed, if it be the effect of habit, to produce the pain of want in a high degree while there is little pleasure in enjoyment, a voluptuous life is of all the least to be envied. Those who are habituated to high feeding, easy vehicles, rich furniture, a crowd of va-

lets, much deference and flattery, enjoy but a small share of happiness, while they are exposed to manifold distresses. To such a man, enslaved by ease and luxury, even the petty inconveniences in travelling, of a rough road, bad weather, or homely fare, are serious evils: he loses his tone of mind, turns peevish, and would wreak his resentment even upon the common accidents of life. Better far to use the goods of Fortune with moderation: a man who by temperance and activity hath acquired a hardy constitution, is, on the one hand, guarded against external accidents; and, on the other, is provided with great variety of enjoyment ever at command.

We shall close this branch of the subject with an article more delicate than abstruse, *viz.* what authority custom ought to have over our taste in the fine arts. One particular is certain, that we cheerfully abandon to the authority of custom things that nature hath left indifferent. It is custom, not nature, that hath established a difference between the right hand and the left, so as to make it awkward and disagreeable to use the left where the right is commonly used. The various colours, though they affect us differently, are all of them agreeable in their purity: but custom has regulated that matter in another manner; a black skin upon a human being, is to us disagreeable; and a white skin probably not less so to a negro. Thus things, originally indifferent, become agreeable or disagreeable by the force of custom. Nor will this be surprising after the discovery made above, that the original agreeableness or disagreeableness of an object, is, by the influence of custom, often converted into the opposite quality.

Proceeding to matters of taste, where there is naturally a preference of one thing before another; it is certain, in the first place, that our faint and more delicate feelings are readily susceptible of a bias from custom; and therefore that it is no proof of a defective taste, to find these in some measure influenced by custom: dress and the modes of external behaviour, are regulated by custom in every country: the deep red or vermilion with which the ladies in France cover their cheeks, appears to them beautiful in spite of nature; and strangers cannot altogether be justified in condemning that practice, considering the lawful authority of custom, or of the *fashion* as it is called: it is told of the people who inhabit the skirts of the Alps facing the north, that the swelling they universally have in the neck is to them agreeable. So far has custom power to change the nature of things, and to make an object originally disagreeable, take on an opposite appearance.

But as to every particular that can be denominated proper or improper, right or wrong, custom has little authority, and ought to have none. The principle of duty takes naturally place of every other; and it argues a shameful weakness or degeneracy of mind, to find it in any case so far subdued as to submit to custom.

II. Effects of Custom and Habit in the animal Economy. These may be reduced to five heads. 1. On the simple solids. 2. On the organs of sense. 3. On the moving power. 4. On the whole nervous power. 5. On the system of blood-vessels.

I. Effects

Custom and
habit.

Galen's lec-
tures on the
Mud. Med.

Custom and
habit.

1. *Effects on the simple solids.* Custom determines the degree of flexibility of which they are capable. By frequently repeated flexion, the several particles of which these solids consist are rendered more supple and moveable on each other. A piece of catgut, *e. g.* when on the stretch, and having a weight appended to its middle, will be bended thereby perhaps half an inch; afterwards, by frequent repetitions of the same weight, or by increasing the weight, the flexibility will be rendered double. The degree of flexibility has a great effect in determining the degree of oscillation, provided that elasticity is not affected; if it go beyond this, it produces flaccidity. Again, custom determines the degree of tension; for the same elastic chord that now oscillates in a certain degree of tension, will, by frequent repetition of these oscillations, be so far relaxed, that the extension must be renewed in order to produce the same tension, and consequently the same vibrations, as at first. This appears in many instances in the animal economy, as when different muscles concur to give a fixed point, or tension to each other: and thus a weakly child totters as it walks; but by giving it a weight to carry, and by thus increasing the tension of the system, it walks more steadily. In like manner the fulness of the system gives strength, by distending the vessels every where, and so giving tension: hence a man, by good nourishment, from being weak, acquires a great increase of strength in a few days; and, on the other hand, evacuations weakened by taking off the tension.

2. *Effects on the Organs of Sense.* Repetition gives a greater degree of sensibility, in so far only as it renders perception more accurate. Repetition alone gives lasting impressions, and thus lays the foundation of memory; for single impressions are but retained for a short time, and are soon forgot. Thus a person, who at present has little knowledge of cloths, will, by frequently handling them, acquire a skill of discerning them, which to others seems almost impossible. Many are apt to mistake this for a nicer sensibility, but they are more mistaken; for it is an universal law, that the repetition of impression renders us less acute. This is well illustrated by the operation of medicines; for all medicines which act on the organs of sense must, after some time, be increased in their dose, to produce the same effects as at first. This affords a rule in practice with regard to these medicines; it becoming necessary, after a certain time, to change one medicine even for a weaker of the same nature. Thus medicines, which even have no great apparent force, are found, by long use, to destroy the sensibility of the system to other impressions. But to this general rule, that, by repetition, the force of impressions is more and more diminished, there are some exceptions. Thus persons, by a strong emetic, have had their stomachs rendered so irritable, that 1-20th of the first dose was sufficient to produce the same effect. This, however, often takes place when the vomit is repeated every day; for if the same vomit be given at pretty considerable intervals, the general rule is observed to hold good. Thus two contrary effects of habit are to be noted; and it is proper to observe, that the greater irritability is more readily produced when the first impression is great, as in the case first given of

the strong emetic. This may be farther illustrated by the effect of fear, which is commonly observed to be diminished on repetition; which can only be attributed to custom: while, on the other hand, there are instances of persons, who, having once got a great fright, have for ever after continued slaves to fears excited by impressions of the like kind, however slight; which must be imputed entirely to excess of the first impression, as has been already observed. To this head also belongs the association of ideas, which is the foundation of memory and all our intellectual faculties, and is entirely the effect of custom; with regard to the body also, these associations often take place. And sometimes, in producing effects on the body, associations seemingly opposite are formed, which, through custom, become absolutely necessary; *e. g.* a person long accustomed to sleep in the neighbourhood of a great noise, is so far from being incommode on that account, that afterwards such noise becomes necessary to produce sleep. It will be of use to attend to this in medical practice; for we ought to allow for, however opposite it may seem at the time, whatever usually attended the purpose we designed to effect. Thus, in the instance of sleep, we must not exclude noise when we want to procure rest, or any causes which may seem opposite to such an effect, provided custom has rendered them necessary.

3. *Effects on the Moving Fibres.* A certain degree of tension is necessary to motion, which is to be determined by custom; *e. g.* a fencer, accustomed to one foil, cannot have the same steadiness or activity with one heavier or lighter. It is necessary also that every motion should be performed in the same situation, or posture of the body, as the person has been accustomed to employ in that motion. Thus, in any surgical operation, a certain posture is recommended; but if the operator has been accustomed to another, such a one, however awkward, becomes necessary afterwards to his right performance of that operation.

Custom also determines the degree of oscillation, of which the moving fibres are capable. A person accustomed to strong muscular exertions is quite incapable of the more delicate. Thus writing is performed by small muscular contractions; but if a person has been accustomed to stronger motions with these muscles, he will write with much less steadiness.

This subject of tension, formerly attributed to the *simple fibres*, is probably more strictly applicable to the moving: for, besides a tension from flexion, there is also a tension from irritation and sympathy; *e. g.* the tension of the stomach from food, gives tension to the whole body. Wine and spiritous liquors give tension; *e. g.* a person that is so affected with tremor as scarcely to hold a glass of any of these liquors to his head, has no sooner swallowed it, than his whole body becomes steady; and after the system has been accustomed to such stimuli, if they are not applied at the usual time, the whole body becomes flaccid, and, of consequence, unsteady in its motions.

Again, custom gives facility of motion. This seems to proceed from the distension which the nervous power gives to the moving fibres themselves. But in whatever manner it is occasioned, the effect is obvious,

Custom and habit, and; for any new or unusual motion is performed with great difficulty.

It is supposed that sensation depends on a communication with the sensorium commune, by means of organs sufficiently distended with nervous influence. We have found, that sensibility is diminished by repetition. And we have now to observe, that in some cases it may be increased by repetition, owing to the nervous power itself flowing more easily into the part on account of custom. Attention to a particular object may also determine a greater influx into any particular part, and thus the sensibility and irritability of that particular part may be increased.

But with regard to facility of motion, the nervous power, no doubt, flows most easily into those parts to which it has been accustomed: yet facility of motion does not entirely depend on this, but in part also on the concurrence of the action of a great many muscles; e. g. Winslow has observed, that, in performing any motion, a number of muscles concur to give a fixed point to those intended chiefly to act, as well as to others that are to vary and modify their action. This, however, is assisted by repetition, and the freer influx; as by experience we know the proper attitude for giving a fixed point in order to perform any action with facility and steadiness.

Custom gives a spontaneous motion also, which seems to recur at stated periods, even when the exciting causes are removed. Thus, if the stomach has been accustomed to vomit from a particular medicine, it will require a much smaller dose than at first, nay, even the very sight or remembrance of it will be sufficient to produce the effect; and there are not wanting instances of habitual vomiting, from the injudicious administration of emetics. It is on this account that all spasmodic affections so easily become habitual, and are so difficult of cure; as we must not only avoid all the exciting causes, even in the smallest degree, but also their associations.

Custom also gives strength of motion: strength depends on strong oscillations, a free and copious influx of the nervous power, and on dense solids. But in what manner all these circumstances have been brought about by repetition, has been already explained. The effect of custom, in producing strength, may be thus illustrated: a man that begins with lifting a calf, by continuing the same practice every day, will be able to lift it when grown to the full size of a bull.

All this is of considerable importance in the practice of physic, though but too little regarded; for the recovery of weak people, in great measure, depends on the use of exercise, suited to their strength, or rather within it, frequently repeated and gradually increased. Farther, it is necessary to observe, that custom regulates the particular celerity with which each motion is to be performed: for a person accustomed, for a considerable time, to one degree of celerity, becomes incapable of a greater; e. g. a man accustomed to slow walking will be out of breath before he can run 20 paces. The train, or order, in which our motions are to be performed, is also established by custom; for if a man hath repeated motions, for a certain time, in any particular order, he cannot afterwards perform them in any other. Custom also very frequently associates

motions and sensations: thus, if a person has been in the use of associating certain ideas with the ordinary stimulus which in health excites urine, without these ideas the usual inclination will scarce excite that excretion; and, when these occur, will require it even in the absence of the primary exciting cause: e. g. it is very ordinary for a person to make urine when going to bed; and if he has been, for any length of time, accustomed to do so, he will ever afterwards make urine at that time, though otherwise he would often have no such inclination: by this means some secretions become, in a manner, subject to the will. The same may be said of going to stool: and this affords us a good rule in the case of costiveness; for by endeavouring to fix a stated time for this evacuation, it will afterwards, at such time, more readily return. It is farther remarkable, that motions are inseparably associated with other motions: this, perhaps, very often proceeds from the necessary degree of tension; but it also often depends merely on custom, an instance of which we have in the uniform motions of our eyes.

4. *Effects on the whole Nervous Power.* We have found, that, by custom, the nervous influence may be determined more easily into one part than another, and therefore, as all the parts of the system are strongly connected, the sensibility, irritability, and strength of any particular part, may be thus increased. Custom also has the power of altering the natural temperament, and of inducing a new one. It is also in the power of custom to render motions periodical, and periodically spontaneous. An instance of this we have in sleep, which is commonly said to be owing to the nervous power being exhausted, the necessary consequence of which is sleep, e. g. a rest of the voluntary motions to favour the recruit of that power: but if this were the case, the return of sleep should be at different times, according as the causes which diminish the nervous influence operate more or less powerfully; whereas the case is quite otherwise, these returns of sleep being quite regular. This is no less remarkable in the appetites, that return at particular periods, independent of every cause but custom. Hunger, e. g. is an extremely uneasy sensation; but goes off of itself, if the person did not take food at the usual time. The excretions are farther proofs of this, e. g. going to stool, which, if it depended on any particular irritation, should be at longer or shorter intervals according to the nature of the aliment. There are many other instances of this disposition of the nervous influence to periodical motions, as the story of the idiot of Stafford, recorded by Dr Plot, (Spectator, n^o 447.) who, being accustomed to tell the hours of the church-clock, as it struck, told them as exactly when it did not strike by its being out of order. Montaigne tells us of some oxen that were employed in a machine for drawing water, who, after making 300 turns, which was the usual number, could be stimulated by no whip or goad to proceed farther. Infants, also, cry for and expect the breast at those times in which the nurse has been accustomed to give it.

Hence it would appear, that the human œconomy is subject to periodical revolutions, and that these happen not oftener may be imputed to variety; and this seems to be the reason why they happen oftener in the body.

Custom and habit.

Custom and
habit
↓
Customs.

body than mind, because that is subject to greater variety. We see frequent instances of this in diseases, and in their crises; intermitting fevers, epilepsies, asthma, &c. are examples of periodical affections: and that critical days are not so strongly marked in this country as in Greece, and some others, may be imputed to the variety and instability of our climate; but perhaps still more to the less sensibility and irritability of our system; for the exhibition of medicine has little effect in disturbing the crises, though it be commonly assigned as a cause.

We are likewise subject to many habits independent of ourselves, as from the revolutions of the celestial bodies, particularly the sun, which determines the body, perhaps, to other daily revolutions besides sleeping and waking. There are also certain habits depending on the seasons. Our connections, likewise, with respect to mankind, are means of inducing habits. Thus regularity from associating in business, induces regular habits both of mind and body.

There are many diseases, which, though they arose at first from particular causes, at last continue merely through custom or habit. These are chiefly of the nervous system. We should, therefore, study to counteract such habits; and accordingly Hippocrates, among other things for the cure of epilepsy, orders an entire change of the manner of life. We likewise imitate this in the chin cough; which often resists all remedies till the air, diet, and ordinary train of life, are changed.

5. *Effects on the Blood-vessels.* From what has been said on the nervous power, the distribution of the fluids must necessarily be variously affected by custom, and with that the distribution of the different excretions; for though we make an estimate of the proportion of the excretion to one another, according to the climate and seasons, they must certainly be very much varied by custom.

On this head we may observe, that blood-letting has a manifest tendency to increase the quantity of the blood; and if this evacuation be repeated at stated times, such symptoms of repletion, and such motions are excited at these times, as render the operation necessary. The same has been observed in some spontaneous hæmorrhages. These, indeed, at first, may have some exciting causes, but afterwards they seem to depend chiefly on custom. The best proof of this is with regard to the menstrual evacuation. There is certainly something originally in females, that determines that evacuation to the monthly periods. Constant repetition of this, comes to fix it, independent of strong causes, either favouring or preventing repletion; e. g. blood-letting will not impede it, nor filling the body induce it: and, indeed, so much is this evacuation connected with periodical motions, that it is little in our power to produce any effect by medicines but at those particular times. Thus if we would relax the uterine system, and bring back this evacuation when suppressed, our attempts would be vain and fruitless, unless given at that time when the menses should have naturally returned.

CUSTOMS, in political economy, or the duties, toll, tribute, or tariff, payable to the king upon merchandize exported and imported, form a branch of the

perpetual taxes. See TAX. The considerations upon which this revenue (or the more ancient part of it, which arose only from exports), was invested in the king, were said to be two: 1. Because he gave the subject leave to depart the kingdom, and to carry his goods along with him. 2. Because the king was bound of common right to maintain and keep up the ports and havens, and to protect the merchant from pirates. Some have imagined they are called with us *customs*, because they were the inheritance of the king by immemorial usage and the common law, and not granted him by any statute: but Sir Edward Coke hath clearly shewn, that the king's first claim to them was by grant of parliament 3 Edw. I. though the record thereof is not now extant. And indeed this is in express words confessed by statute 25 Edw. I. c. 7. wherein the king promises to take no customs from merchants, without the common assent of the realm, "saying to us and our heirs, the customs on wool, skins, and leather, formerly granted to us by the commonalty aforesaid." These were formerly called *hereditary customs* of the crown; and were due on the exportation only of the said three commodities, and of none other: which were styled the *staple* commodities of the kingdom, because they were obliged to be brought to those ports where the king's staple was established, in order to be there first rated, and then exported. They were denominated in the barbarous Latin of our ancient records, *custumæ*, (an appellation which seems to be derived from the French word *costum*, or *coûtum*, which signifies toll or tribute, and owes its own etymology to the word *costi*, which signifies price, charge, or, as we have adopted it in English, *cost*); not *consuetudines*, which is the language of our law whenever it means merely usages. The duties on wool, sheep-skins or woollens, and leather, exported, were called *custumæ antiquæ sive magnæ*: and were payable by every merchant, as well native as stranger; with this difference, that merchant-strangers paid an additional toll, viz. half as much again as was paid by natives. The *custumæ parvæ et novæ* were an impost of 3d. in the pound, due from merchant-strangers only, for all commodities as well imported as exported; which was usually called the *alien's* duty, and was first granted in 31 Edw. I. But these ancient hereditary customs, especially those on wool and woollens, came to be of little account, when the nation became sensible of the advantages of a home manufacture, and prohibited the exportation of wool by statute 11 Edw. III. c. 1.

Other customs payable upon exports and imports were distinguished into subsidies, tonnage, poundage, and other imposts. Subsidies were such as were imposed by parliament upon any of the staple commodities before mentioned, over and above the *custumæ antiquæ et magnæ*: tonnage was a duty upon all wines imported, over and above the prisage and butlerage aforesaid: poundage was a duty imposed *ad valorem*, at the rate of 12 d. in the pound, on all other merchandize whatsoever: and the other imposts were such as were occasionally laid on by parliament, as circumstances and times required. These distinctions are now in a manner forgotten, except by the officers immediately concerned in this department; their produce

Customs.

Customs. duce being in effect all blended together, under the one denomination of the *customs*.

By these we understand, at present, a duty or subsidy paid by the merchant, at the quay, upon all imported as well as exported commodities, by authority of parliament; unless where, for particular national reasons, certain rewards, bounties, or drawbacks, are allowed for particular exports or imports. The customs thus imposed by parliament, are chiefly contained in two books of rates, set forth by parliamentary authority; one signed by Sir Harbottle Grimston, speaker of the house of commons in Charles the second's time; and the other an additional one signed by Sir Spenser Compton, speaker in the reign of George the first; to which also subsequent additions have been made. Aliens pay a larger proportion than natural subjects, which is what is now generally understood by the aliens duty; to be exempted from which is one principal cause of the frequent applications to parliament for acts of naturalization.

These customs are then, we see, a tax immediately paid by the merchant, although ultimately by the consumer. And yet these are the duties felt least by the people; and, if prudently managed, the people hardly consider that they pay them at all. For the merchant is easy, being sensible he does not pay them for himself; and the consumer, who really pays them, confounds them with the price of the commodity: in the same manner as Tacitus observes, that the emperor Nero gained the reputation of abolishing the tax of the sale of slaves, though he only transferred it from the buyer to the seller; so that it was, as he expresses it, "*remissum magis specie, quam vi: quia, cum venditor pendere juberetur, in partem pretii emptoribus accrescebat.*" But this inconvenience attends it on the other hand, that these imposts, if too heavy, are a check and cramp upon trade; and especially when the value of the commodity bears little or no proportion to the quantity of the duty imposed. This in consequence gives rise also to smuggling, which then becomes a very lucrative employment: and its natural and most reasonable punishment, *viz.* confiscation of the commodity, is in such cases quite ineffectual; the intrinsic value of the goods, which is all that the smuggler has paid, and therefore all that he can lose, being very inconsiderable when compared with his prospect of advantage in evading the duty. Recourse must therefore be had to extraordinary punishments to prevent it; perhaps even to capital ones: which destroys all proportion of punishment, and puts murderers upon an equal footing with such as are really guilty of no natural, but merely a positive offence.

There is also another ill consequence attending high imposts on merchandise, not frequently considered, but indubitably certain; that the earlier any tax is laid on a commodity, the heavier it falls upon the consumer in the end: for every trader, through whose hands it passes, must have a profit, not only upon the raw material and his own labour and time in preparing it, but also upon the very tax itself, which he advances to the government; otherwise he loses the use and interest of the money which he so advances.

VOL. III.

To instance in the article of foreign paper. The merchant pays a duty upon importation, which he does not receive again till he sells the commodity, perhaps at the end of three months. He is therefore equally entitled to a profit upon that duty which he pays at the custom-house, as to a profit upon the original price which he pays to the manufacturer abroad; and considers it accordingly in the price he demands of the stationer. When the stationer sells it again, he requires a profit of the printer or bookseller upon the whole sum advanced by him to the merchants: and the bookseller does not forget to charge the full proportion to the student or ultimate consumer; who therefore does not only pay the original duty, but the profits of these three intermediate traders, who have successively advanced it for him. This might be carried much farther in any mechanical, or more complicated, branch of trade.

CUSTOM-HOUSE, an office established by the king's authority in the maritime cities, or port-towns, for the receipt and management of the customs and duties of importation and exportation, imposed on merchandises, and regulated by books of rates.

CUSTOS BREVIUM, the principal clerk belonging to the court of common pleas, whose business it is to receive and keep all the writs made returnable in that court, filing every return by itself; and, at the end of each term, to receive of the prothonotaries all the records of the nisi prius, called the *posseas*.

CUSTOS ROTULORUM, an officer who has the custody of the rolls and records of the sessions of peace, and also of the commission of the peace itself.

He usually is some person of quality, and always a justice of the peace, of the quorum, in the county where he is appointed.

CUSTOS SPIRITUALIUM, he that exercises the spiritual jurisdiction of a diocese, during the vacancy of any see, which, by the canon-law, belongs to the dean and chapter; but at present, in England, to the archbishop of the province, by prescription.

CUSTOS TEMPORALIUM, was the person to whom a vacant see or abbey was given by the king, as supreme lord. His office was, as steward of the goods and profits, to give an account to the exchequer, who did the like to the exchequer.

CUT-A-FEATHER, in the sea-language. If a ship has too broad a bow, it is common to say, *she will not cut a feather*; that is, she will not pass through the water so swift, as to make it foam or froth.

CUT-WATER, the sharp part of the head of a ship below the beak. It is so called because it cuts or divides the water before it comes to the bow, that it may not come too suddenly to the breadth of the ship, which would retard her.

CUTANEOUS, in general, an appellation given to whatever belongs to the cutis, or skin.

CUTICLE, the scarf-skin. See *ANATOMY*, n° 73.

CUTICULAR, the same with *Cutaneous*.

CUTIS, the skin. See *ANATOMY*, n° 75.

CUTTER, a small vessel, commonly navigated in the channel of England. It is furnished with one mast, and rigged as a *sloop*. Many of these vessels are used in an illicit trade, and others are employed by government to take them; the latter of which are

Custom
|
Cutter.

Cutter
|
Cutting.

either under the direction of the admiralty or custom-house. See a representation of a cutter of this sort in the plate referred to from the article *VESSEL*.

CUTTER, is also a small boat used by ships of war.

CUTTER of the *Tallies*, an officer of the exchequer, whose business is to provide wood for the tallies, to cut or notch the sum paid upon them; and then to cast them into court, to be written upon. See *TALLY*.

CUTTING in wood, a particular kind of sculpture, or engraving; denominated from the matter wherein it is employed. See *ENGRAVING*.

It is used for various purposes; as, for initial or figured letters, head and tail-pieces of books; and even for schemes and other figures, to save the expences of engraving on copper: and for prints, and stamps for paper, calicoes, linens, &c. See *PRINTING*.

The invention of *cutting in wood*, as well as that in copper, is ascribed to a goldsmith of Florence; but it is to Albert Durer, and Lucas, they are both indebted for their perfection.

One Hugo de Carpi invented a manner of cutting in wood, by means whereof, the prints appeared as if painted in clear-obscure. In order to this, he made three kinds of stamps for the same design; which were drawn, after one another, through the press for the same print: they were so conducted, as that one served for the grand lights, a second for the demi-teints, and a third for the outlines, and the deep shadows.

The art of cutting in wood, was certainly carried to a very great pitch about 150 years ago; and might even vie, for beauty and justness, with that of engraving in copper: at present it is in a low condition, as having been long neglected, and the application of artists wholly employed on copper, as the more easy and promising province; not but that wooden cuts have the advantage of those in copper on many accounts; chiefly for figures and devices in books; as being printed at the same time, and in the same press as the letters: whereas, for the other, there is required a particular impression.

The cutters in wood begin with preparing a plank or block, of the size and thickness required, and very even and smooth on the side to be cut: for this, they usually take pear-tree, or box; though the latter is the best, as being the closest, and least liable to be worm-eaten.

On this block they draw their design with a pen, or pencil, just as they would have it printed. Those who cannot draw their own design, as many there are cannot, make use of a design furnished them by another; fastening it upon the block with paste made of flower and water, with a little vinegar; the strokes or lines turned towards the wood.

When the paper is dry, they wash it gently over with a sponge dipped in water; which done, they take off the paper by little and little, still rubbing it a little first, with the tip of the finger; till at length there be nothing left on the block, but the strokes of ink that form the design, which mark out so much of the block as is to be spared, or left standing.

The rest they cut off, and take away very curiously with the points of very sharp knives, or little chisels, or gravers, according to the bigness or delicacy of the work; for they need no other instruments.

Cuttle
|
Cyclamen.

CUTTLE-FISH. See *SEPIA*. The bone of the cuttle-fish is hard on one side, but soft and yielding on the other; so as readily to receive pretty neat impressions from medals, &c. and afterwards to serve as a mould for casting metals, which thus take the figure of the original: the bone is likewise frequently employed for cleaning or polishing silver. This fish contains in a certain distinct vessel a fluid as black as ink: which it is said to shed when pursued, and thus to conceal itself by discolouring the water. The particular qualities of this liquor are not yet determined. Dr Leigh says, he saw a letter which had been written with it ten years before, and which still continued. Some report that the ancients made their ink from it, and others, that it is the basis of China, or Indian-ink: but both these accounts appear to have little foundation. Pliny, speaking of the inks made use of in his time, after observing that the cuttle-fish is in this respect of a wonderful nature, adds, expressly, that ink was not made from it.

CYANUS, in botany. See *CENTAUREA*.

CYATHUS, *κύνθος*, from the verb *κύνω*, to pour out. It was a common measure among the Greeks and Romans, both of the liquid and dry kind. It was equal to an ounce, or the twelfth part of a pint. The cyathus was made with an handle like our punch-ladle. The Roman topers were used to drink as many *cyathi* as there were muses, i. e. nine; also as many as there were letters in the patron's name. Thus, they had modes of drinking similar to the modern health-drinking, or toasting. Pliny says, that the cyathus of the Greeks weighed 12 drachms; and Galen says the same; though elsewhere he says, that a cyathus contains 12 drachms of oil, 13 drachms and one scruple of wine, water, or vinegar, and 18 drachms of honey. Galen says, that among the Veterinarii the cyathus contained two ounces.

CYAXARES, king of the Medes, after his father Phraortes, *an. mund.* 3379, besieging Niniveh, he was forced to return to defend his own country against the Scythians, who defeated him. However, he defeated them afterward; and then made himself master of Assyria; entered into Lydia, which had sheltered the Scythians; and died, after 40 years reign.

CYBELÉ, in Pagan Mythology, the daughter of Cælus and Terra, and the wife of her brother Saturn, was also called the mother of the gods, *Ops*, *Rhea*, *Vesta*, *Dyndimina*, *Berecynthia*, the good goddess, &c. in which different characters he had different representations, and different sacrifices.

CYBELICUM MARMOR, a name given by the ancients to a species of marble dug in a mountain of that name in Phrygia. It was of an extremely bright white, with broad veins of bluish black.

CYCLAMEN, *ΣΩΒΕΒΡΕΑ*; a genus of the monogynia order, belonging to the pentandria class of plants. There are but two species; which, however, produce many beautiful varieties. They are low herbaceous, flowery perennials of the tuberous rooted kind, with numerous, angular, heart-shaped, spotted, marbled leaves; with many fleshy foot-stalks fix reflexed high, carrying monopetalous, five-parted inclined flowers of various colours. All the varieties are extremely ornamental, and some of the flowers very fragrant.

fragrant. They may be planted in any of the common borders, but require to be sheltered from hard frosts by being covered with mats. They should also have a light dry soil, otherwise their roots are apt to rot. The species are propagated by seeds, and the particular varieties by dividing their roots.

The root of the cyclamen has, when fresh, an extremely acrimonious, burning taste, which it loses almost entirely on being dried. It is recommended as an emetic; in cataplasms for scorchous and cancerous tumours; as internally as a cathartic, detergent, and aperient. It operates very slowly, but with great violence, inflaming the fauces and intestines.

CYCLE, in chronology, a certain period or series of numbers, which regularly proceed from the first to the last, and then return again to the first, and so circulate perpetually. See ASTRONOMY, n° 303.—308.

CYCLE of *Indiction*, a period of 15 years, in use among the Romans. It has no connection with the celestial motion, but was instituted, according to Baronius, by Constantine; who having reduced the time which the Romans were obliged to serve to 15 years, he was, consequently, obliged every 15 years to impose, or *indicare*, according to the Latin expression, an extraordinary tax for the payment of those who were discharged; and hence arose this cycle, which, from the Latin word *indicare*, was styled *indiction*. *Ibid.*

CYCLE of the *Moon*, called also the *golden number*, and the *Metonic cycle* from its inventor Meton the Athenian, is a period of 19 years, which when they are completed, the new moons and full moons return on the same days of the month, so that on whatever days the new and full moons fall this year, 19 years hence they will happen on the very same days of the month, though not at the same hour, as Meton and the fathers of the primitive church thought; and therefore, at the time of the council of Nice, when the method of finding the time for observing the feast of Easter was established, the numbers of the lunar-cycle were inserted in the calendar, which, upon the account of their excellent use, were set in golden letters, and the year of the cycle called the *golden number* of that year. *Ibid.* n° 304.

CYCLE of the *Sun*, a revolution of 28 years, which being elapsed, the dominical or Sunday-letters return to their former place, and proceed in the same order as before, according to the Julian calendar. See ASTRONOMY, n° 303.

CYCLISUS, in surgery, an instrument in the form of a half moon, used in scraping the skull, in case of fractures of that part.

CYCLOID, a curve on which the doctrine of pendulums, and time-measuring instruments, in a great measure depend; Mr Huygens demonstrated, that from whatever point or height a heavy body, oscillating on a fixed centre, begins to descend, while it continues to move in a cycloid, the time of its falls or oscillations will be equal to each other. It is likewise demonstrable, that it is the curve of quickest descent, *i. e.* a body falling in it, from any given point above, to another, not exactly under it, will come to this point in a less time than in any other curve passing through those two points.

CYCLOPÆDIA, or ENCYCLOPÆDIA, denotes the Cyclopædia circle or compas of arts and sciences. A cyclopædia, say the authors of the French Encyclopædia, ought to explain as much as possible the order and connection of human knowledge.

CYCLOPS, in fabulous history, the sons of Neptune and Amphitrite; the principal of whom were Brontes, Steropes, and Pyracmon; but their whole number amounted to above an hundred. Jupiter threw them into Tartarus as soon as they were born; but they were delivered at the intercession of Tellus, and became the assistants of Vulcan. They were of prodigious stature, and had each only one eye, which was placed in the middle of their foreheads.

Some mythologists say, that the Cyclops signify the vapours raised in the air, which occasion thunder and lightning; on which account they are represented as forging the thunder-bolts of Jupiter. Others represent them as the first inhabitants of Sicily, who were cruel, of a gigantic form, and dwelt round mount Ætna.

CYCLOPTERUS, the *SUCKER*, in ichthyology, a genus belonging to the order of amphibia nantes. The head is obtuse, and furnished with saw-teeth; there are four rays in the gills; and the belly-fins are connected together in an orbicular form. The species are,

1. The *lumpus*, or *lump-fish*, grows to the length of 19 inches, and weighs seven pounds: the shape of the body is like that of the bream, deep and very thick, and it swims edge-ways. The back is sharp and elevated; the belly flat, of a bright crimson colour: along the body there run several rows of sharp bony tubercles, and the whole skin is covered with small ones. The pectoral fins are large and broad, almost uniting at their base. Beneath these is the part by which it adheres to the rocks, &c. It consists of an oval aperture, surrounded with a fleshy, muscular, and obtuse soft substance; edged with many small threaded appendages which concur as so many claspers: the tail and vent-fins are purple. By means of this part it adheres with vast force to any thing it pleases. As a proof of its tenacity, it hath been known, that in flinging a fish of this species just caught, into a pail of water, it fixed itself so firmly to the bottom, that on taking the fish by the tail, the whole pail by that means was lifted, though it held some gallons, without once making the fish quit its hold. These fish resort in multitudes during spring to the coast of Sutherland near the Ord of Caithness. The seals which swarm beneath, prey greatly upon them leaving the skins; numbers of which thus emptied, float ashore at that season. It is easy to distinguish the place where the seals are devouring this or any other unctuous fish, by a smoothness of the water immediately above the spot; this fact is now established: it being a tried property of oil to still the agitation of the waves, and render them smooth. Great numbers of lump-fish are found in the Greenland seas during the months of April and May, when they resort near the shore to spawn. Their roe is remarkably large, which the Greenlanders boil to a pulp and eat. They are extremely fat, which recommends them the more to the natives, who admire all oily food: they call them *nipitsi*, or *cat-fish*, and take quantities of them during

Cyder.

Cyder.

the season. The fish is sometimes eaten in England, being stewed like carp; but is both flabby and insipid.

2. The liparis takes the name of *sea-fnail* from the soft and unctuous texture of its body, resembling that of the land-fnail. It is almost transparent, and soon dissolves and melts away. It is found in the sea near the mouths of great rivers, and hath been seen full of spawn in January. The length is five inches; the colour a pale brown sometimes finely streaked with a darker. Beneath the throat is a round depression of a whitish colour like the impression of a seal, surrounded by twelve small pale yellow tubera by which probably it adheres to the stones like the other species.

3. The lesser sucking-fish is found in different parts of the British seas. It is about four inches in length; the skin without scales, slippery, and of a dusky colour. It hath also an apparatus for adhering to stones and rocks similar to the others.

CYDER, or CIDER, an excellent drink made of the juice of apples, especially of the more curious table kinds; the juice of these being esteemed more cordial and pleasant than that of the wild or harsh kinds. In making this drink it hath long been thought necessary, in every part of England, to lay the harder cyder-fruits in heaps for some time before breaking their pulps; but the Devonshire people have much improved this practice. In other counties the method is to make these heaps of apples in a house, or under some covering inclosed on every side. This method hath been found defective, because, by excluding the free air, the heat soon became too violent, and a great perspiration ensued, by which in a short time the loss of juices were so great, as to reduce the fruit to half their former weight, attended with a general rotteness, rancid smell, and disagreeable taste. In the South-hams, a middle way has been pursued, to avoid the inconveniences and loss attending the above. They make their heaps of apples in an open part of an orchard, where, by the means of a free air and less perspiration, the desired maturity is brought about, with an inconsiderable waste of the juices and decay of the fruit, entirely free of rankness; and though some apples rot, even in this manner, they are very few, and are still fit for use; all continue plump and full of juices, and very much heighten the colour of cyders, without ill taste or smell.

In pursuing the Devonshire method, it is to be observed, 1. That all the promiscuous kinds of apples that have dropped from the trees, from time to time, are to be gathered up and laid in a heap by themselves, and to be made into cedar after having so lain about ten days.

2. Such apples as are gathered from the trees, having already acquired some degree of maturity, are likewise to be laid in a heap by themselves for about a fortnight.

3. The latter hard fruits, which are to be left on the trees till the approach of frost is apprehended, are to be laid in a separate heap, where they are to remain a month or six weeks, by which, notwithstanding frost, rain, &c. their juices will receive such a maturation, as will prepare them for a kindly fermentation, and which they could not have attained on the trees by means of the coldness of the season.

It is observable, that the riper and mellowier the fruits are at the time of collecting them into heaps, the shorter should be their continuance there; and on the contrary, the harrier, immaturer, and harder they are, the longer they should rest.

These heaps should be made in an even and open part of an orchard, without any regard to covering from rain, dews, or what else may happen during the apples staying there; and whether they be carried in and broke in wet or dry weather, the thing is all the same. If it may be objected that during their having lain together in the heap, they may have imbibed great humidity, as well from the air as from the ground, rain, dews, &c. which are mixed with their juices; the answer is, this will have no other effect than a kindly diluting, natural to the fruit, by which means a speedier fermentation ensues, and all heterogeneous humid particles are thrown off.

The apples are then ground, and the pumice is received in a large open-mouthed vessel, capable of containing as much thereof as is sufficient for one making, or one cheese. Though it has been a custom to let the pumice remain some hours in the vessel appropriated to contain it, yet that practice is by no means commendable; for if the fruits did not come ripe from the trees, or otherwise matured, the pumice, remaining in the vat too long, will acquire such harshness and coarseness from the skins as is never to be got rid of; and if the pumice is of well ripened fruit, the continuing too long there will occasion it to contract a sharpness that very often is followed with want of spirit and pricking; nay, sometimes it even becomes vinegar, or always continues of a wheyish colour; all which proceeds from the heat of fermentation that it almost instantly falls in on lying together; the pumice therefore should remain no longer in the vat, than until there may be enough broke for one pressing, or that all be made into a cheese, and pressed the same day it is broken.

Plate LXXXVI. fig. 2. is a perspective view of the cyder-press and apple-mill.

A, B, the bottom, or lower beam; C, D, the upper beam; 5, 6, 7, 8, 9, the uprights; 4, 4, e, e, spurs; Z, 2, 12, braces, or cross pieces; a, b, capitals; X, blocks; g, the screw; E, the back, or receiver; F, the cheele, or cake of pumice, placed on the flage or bafon; G, the flage or bafon; 10, 10, beams that support the pieces of which the bafon is composed; 11, perpendicular pieces for supporting these beams; H, the buckler; R, S, Q, a circular trough of the apple-mill; T, L, V, compartments, or divisions, for different sorts of apples; M, the mill-stone; L, M, axis of the mill-stone; N, the spring-tree bar.

CYDER-Spirit, a spirituous liquor drawn from cyder by distillation, in the same manner as brandy from wine. The particular flavour of this spirit is not the most agreeable, but it may with care be divested wholly of it, and rendered a perfectly pure and insipid spirit upon rectification. The traders in spirituous liquors are well enough acquainted with the value of such a spirit as this: they can give it the flavours of some other kinds, and sell it under their names, or mix it in large proportion with the foreign brady,

rum,

rum, and arrack, in the sale, without any danger of a discovery of the cheat.

CYDONIA, the QUINCE; so called from Cydon, a town of Crete, famous for its abounding with this fruit. Linnæus has joined this genus to the apple and pear; but as there is such a remarkable difference between the fruits, we follow Mr Miller, who treats the quince as a genus by itself.

Species. 1. The oblonga with an oblong fruit, lengthened at the base. 2. The maliforma, with oval leaves woolly on their under side, and lengthened at their base. 3. The lusitanica with overise oval leaves, woolly on their under side. There are some other varieties of this fruit propagated in fruit-gardens, and in the nurseries for sale; one of which is a soft eatable fruit, another very astringent, and a third with a very small fruit cottony all over, which is scarce worth keeping. These Mr Miller supposes to be seminal variations, but the three others to be distinct species. The Portugal quince is the most valuable: its pulp turns to a fine purple when stewed or baked, and becomes much softer and less austere than the others; so is much fitter for making marmalade. The trees are all easily propagated, either by layers, suckers, or cuttings, which must be planted in a moist soil. Those raised from suckers are seldom so well rooted as those which are obtained from cuttings or layers, and are subject to produce suckers again in greater plenty; which is not so proper for fruit-bearing trees. These trees require very little pruning; the chief thing to be observed is, to keep their stems clear from suckers, and cut off such branches as cross each other: likewise all upright luxuriant shoots from the middle of the tree should be taken off, that the head may not be too much crowded with wood, which is of ill consequence to all fruit-trees. These sorts may also be propagated by budding or grafting upon stocks raised by cuttings; so that the best sorts may be cultivated this way in greater plenty than by any other method. These are also in great esteem to bud or graft pears upon; which for summer or autumn fruits are a great improvement to them, especially those designed for walls and espaliers; for the trees upon these stocks do not shoot so vigorously as those upon free-stocks, and therefore may be kept in less compass, and sooner produce fruit: but hard winter-fruits do not succeed so well upon these stocks, their fruit being subject to crack, and are commonly stony, especially all the breaking pears: therefore these stocks are only fit for melting pears and a moist soil.

CYGNUS, or SWAN, in ornithology. See ANAS.

CYGNUS, in astronomy, the *Swan*, a constellation of the northern hemisphere. See ASTRONOMY, n° 206.

CYLINDER, in geometry, a solid body supposed to be generated by the rotation of a parallelogram.

Rolling or Loaded CYLINDER. See MECHANICS, n° 52.

CYLINDROID, in geometry, a solid body, approaching to the figure of a cylinder, but differing from it in some respects, as having the bases elliptical, but parallel and equal.

CYLINDRUS, in natural history, the name of a genus of shell-fish, of which there are many elegant and

precious species. See two specimens on Plate LXXXIII. fig. 4.

CYMA, in botany, the tender stalks which herbs send forth in the beginning of the spring, particularly those of the cabbage kind.

CYMA, or CYMATIUM, in architecture, a member or moulding of the cornice, the profile of which is waved, that is concave at top, and convex at bottom. See Plate XXIX. fig. 7.

CYMBAL, *κymbalon*, a musical instrument in use among the ancients. The cymbal was round, made of brass, like our kettle-drums, and as some think, in their form, but smaller, and of different use. Ovid gives cymbals the epithet of *genialia*, because they were used at weddings and other diversions. The Jews had their cymbals, or at least instruments which translators render cymbals; but as to their matter and form, critics are still in the dark. The modern cymbal is a mean instrument, chiefly in use among vagrants, gypsies, &c.

CYMENE, in botany, a name given by the ancient Greeks to a plant with which they used to dye woolen things yellow, and with which the women of those times used also to tinge the hair yellow, that being the favourite colour in those ages. The *cymene* of the Greeks is evidently the same plant with the *lutea herba* of the Latins; or what we call *dyer's weed*. See RESEDA.

CYNANCHE, a species of quincy, in which the tongue is inflamed and swelled, so that it hangs out beyond the teeth.

CYNANCHUM, RASTARD DOGSBANE; a genus of the digynia order, belonging to the pentandria class of plants. There are six species, of which the following are the most remarkable. 1. The actum, commonly called *Montpelier scammony*; and 2. The *monspeliacum*, or round-leaved Montpelier scammony. They abound with a milky juice like the spurge, which issues out wherever they are broken; and this milky juice when concreted, has frequently been sold for scammony. These plants propagate so fast by their creeping roots, that few people care to admit them into gardens.

CYNANTHROPIA, in medicine, the distemper occasioned by the bite of a mad dog. See (the *Index* subjoined to) MEDICINE.

CYNARA, the ARTICHOKE; a genus of the polygama æqualis order, belonging to the syngenesia class of plants. Of this genus there are four species, but only two are cultivated for use.

1. The scolynius, or garden artichoke, hath large, thick, perennial roots, crowned by a considerable cluster of large pennatifid, erect leaves, two or three feet long. In the middle are upright stalks rising a yard high, on the top of which is a large round scaly head, composed of numerous, oval, calycinal scales, inclosing the florets, sitting on a broad fleshy receptacle, which, with the fleshy base of the scales, is the only eatable part of the plant. The varieties of this species are, (1.) The *conical green-headed French artichoke*, having the small leaves terminated by spines, a tall stalk, the head somewhat conical, and of a light green colour, with the scales pointed at top, opening and turning outward. (2.) The *globular-headed red*, Dutch artichoke,

Cyma.
|
Cynara.

Cynurus
|
Cynicus.

artichok, having leaves without spines, a strong stalk, the head large, globular, a little compressed at top, and of a reddish-green colour; broad obtuse scales emerginated at top, growing close, and turning inward. Of these varieties the last is deservedly the most esteemed, both on account of its superiority in size, and the agreeableness of its flavour. Both varieties are perennial in their root: but the leaves and fruit-stem die to the ground in winter, and their roots remaining send up fresh leaves and stems every summer, producing a supply of artichoks for 20 years if required. The flowers and seed of all the plants of this genus are produced in the centre of the head, the scales of which are the proper calix of the flower, which consists of numerous small bluish florets, succeeded by downy seeds fitting naked on the receptacle.

2. The *cardunculus*, or cardoon, greatly resembles the artichok, but is of larger and more regular growth; the leaves being more upright, taller, broader, and more regularly divided; and the stalks of the leaves blanched are the only eatable parts of the plant.

Culture. Both the varieties of the artichok are propagated by slips or suckers, arising annually from the stool or root of the old plants in spring, which are to be taken from good plants of any present plantation in March, or the beginning of April, and planted in the open quarter of the kitchen-garden, in rows five feet asunder; and they will produce artichoks the same year in autumn. It should, however, be remarked, that though artichoks are of many years duration, the annual produce of their fruit will gradually lessen in the size of the eatable parts after the third or fourth year, so that a fresh plantation should be made every three or four years. The cardoon is a very hardy plant, and prospers in the open quarters of the kitchen-garden. It is propagated by seed sowed annually in the full ground, in March; either in a bed for transplantation, or in the place where they are designed to remain. The plants are very large, so must stand at considerable distances from one another. By this means you may have some small temporary crops between the rows, as of lettuce, spinach, endive, cabbage, fanny, or broccoli plants. In the latter end of September, or in October, the cardoons will be grown very large, and their foot-stalks have acquired a thick substance; you must then tie up the leaves of each plant, to admit of earthing them up closely all round for blanching, which will take up six or eight weeks; and thus the plants will come in for use in November and December, and continue all winter.

CYNÆAS of Theffaly, the scholar of Demosthenes, flourished 275 years before Christ. Pyrrhus had so high an esteem for him, that he sent him to Rome to solicit a peace; and so vast was his memory, that the day after his arrival, he saluted all the senators and knights by name. Pyrrhus and he wrote a treatise of War, quoted by Tully.

CYNICS, a sect of ancient philosophers, who valued themselves upon their contempt of riches and state, arts and sciences, and every thing, in short, except virtue or morality.

The cynic philosophers owe their origin and institution to Antisthenes of Athens, a disciple of Socrates, who, being asked of what use his philosophy had been

to him, replied, "It enables me to live with myself." Diogenes was the most famous of his disciples, in whose life the system of this philosophy appears in its greatest perfection: he led a most wretched life, a tub having served him for a lodging, which he rolled before him where ever he went; yet he was, nevertheless, not the more humble on account of his ragged cloak, bag, and tub: for, one day, entering Plato's house, at a time that there was a splendid entertainment there for several persons of distinction, he jumped up upon a very rich couch, in all his dirt, saying, "I trample on the pride of Plato." "Yes, (replied Plato), but with great pride, Diogenes." He had the utmost contempt for all the human race, for he walked the streets of Athens, at noon-day, with a lighted lantern in his hand, telling the people, "He was in search of a man." Amongst many excellent maxims of morality, he held some very pernicious opinions; for he used to say, that the uninterrupted good fortune of Harpalus, who generally passed for a thief and a robber, was a testimony against the gods. He regarded chastity and modesty as weaknesses; hence Laertius observes of him, that he did every thing openly, whether it belonged to Ceres or Venus, though he adds that Diogenes only ran to an excess of impudence to put others out of conceit with it: but impudence was the characteristic of these philosophers, who argued, that what was right to be done, might be done at all times, and in all places. The chief principle of this sect, in common with the stoics, was, that we should follow nature; but they differed from the stoics in their explanation of that maxim, the cynics being of opinion that a man followed nature, that gratified his natural motions and appetites; while the stoics understood right reason, by the word nature.

CYNIC *Spasmus*, a kind of convulsion, wherein the patient imitates the howlings of dogs.

CYNOCEPHALUS, in zoology, the trivial name of a species of SIMIA.

CYNOGLOSSUM, HOUND'S TONGUE; a genus of the monogynia order, belonging to the pentandria class of plants. Their are eight species, none of them remarkable for their beauty. The root of one of them, *viz.* the officinale, or common greater hound's tongue was formerly used in medicine, and supposed to possess narcotic virtues; but it is discarded from the present practice. The smell of the whole plant is very disagreeable. Goats eat it; sheep, horses, and swine refuse it.

CYNOREXY, an immoderate appetite, to the degree of a disease; called also *fames canina*, and *bulimy*.

CYNOSURA, in astronomy, a denomination given by the Greeks to *ursa minor*, or "the little bear," by which sailors steer their course. The word is formed of *κυνος*, *q. d. the dog's tail*. This is the constellation next our pole, consisting of seven stars; four whereof are disposed like the four wheels of a chariot, and three lengthwise representing the beam; whence some give it the name of the *chariot*, or *Charles's wain*.

CYNOSURUS, in botany, a genus of the triandria dyginia class. There are ten species, four of which are natives of Britain, *viz.* the *cristatus*, or crested dog-tail

Cynic

Cynosurus.

pernis.
Cyprianus.

dog-tail grafs; the echinatus, or rough dog-tail grafs; the cæruleus, or blue dog-tail grafs; and the paniceus, or bearded dog-tail grafs.

CYPHERUS, in botany, a genus of the monogynia order, belonging to the pentandria class of plants. There are 20 species, the only remarkable are the round and the long sweet cyperus. The former is a native of the East Indies, and grows by the sides of rivulets, ditches, and the like. The root is knotty, wrapped round with fibrous strings not easy to break, of a brown colour without, and grey within; of a pleasant scent, especially when fresh, and well dried; the leaves are green, and resemble those of the reed and leek. The latter, commonly called *English*, or *Flemish cyperus*, grows in the water, and along banks and river sides. Its root is as thick as an olive, full of little knots or specks, of an oblong figure, grey colour; sweet, and somewhat sharp taste, and almost without smell when it is newly taken out of the ground. The roots of both plants are esteemed cordial, diuretic, and cephalic, resisters of poisons, and expellers of wind. Long cyperus is much used by perfumers and glovers.

CYPRÆA, in zoology, a genus of insects belonging to the order of vermes testacea. It is an animal of the limax or snail kind; the shell is one involuted, subovated, obtuse, smooth valve. The aperture on each side is linear, longitudinal, and toothed. There are forty-four species, distinguished by the form of their shells. The pediculus, or common gowrie, is represented Plate LXXXII. fig. 14.

This genus is called *cypræa*, and *venerea*, from its being peculiarly dedicated to Venus; who was said to have endowed a shell of this genus with the powers of a *remora*, so as to impede the course of the ship which was sent by Periander tyrant of Corinth, with orders to castrate the young nobility of Corcyra.

CYPRESS. See CUPRESSUS.

CYPRIANUS (Thascius-Cæcilius), a principal father of the Christian church, was born at Carthage in Africa, at the latter end of the second or beginning of the third century. We know nothing more of his parents than that they were heathens; and he himself continued such till the last 12 years of his life. He applied himself early to the study of oratory; and some of the ancients, particularly Lactantius, inform us, that he taught rhetoric in Carthage with the highest applause. Cyprian's conversion is fixed by Pearson to the year 246; and was at Carthage, where, as St Jerome observes, he had often employed his rhetoric in the defence of paganism. It was brought about by one Cæcilius, a priest of the church of Carthage, whose name Cyprian afterwards took; and between whom there ever after subsisted so close a friendship, that Cæcilius at his death committed to Cyprian the care of his family. Cyprian was also a married man himself; but as soon as he was converted to the faith, he resolved upon a state of continence, which was thought a high degree of piety, as not being yet become general. Being now a Christian, he was to give the usual proof of the sincerity of his conversion; and that was by writing against paganism and in defence of Christianity. With this view he composed his piece *De Gratia Dei*, or "concerning

the grace of God," which he addressed to Donatus. It is a work of the same nature with the Apologetic of Tertullian, and the Oclavius of Minutius Felix. He next composed a piece *De Idolorum Vanitate*, or "upon the vanity of idols." Cyprian's behaviour, both before and after his baptism, was so highly pleasing to the bishop of Carthage, that he ordained him a priest a few months after. It was rather irregular to ordain a man thus in his very novitiate; but Cyprian was so extraordinary a person, and thought capable of doing such singular service to the church, that it seemed allowable in his case to dispense a little with the form and discipline of it. For besides his known talents as a secular man, he had acquired a high reputation of sanctity since his conversion; having not only separated himself from his wife, as we have observed before, which in those days was thought an extraordinary act of piety, but also consigned over all his goods to the poor, and given himself up entirely to the things of God. It was on this account no doubt, too, that when the bishop of Carthage died the year after, that is, in the year 248, none was judged so proper to succeed him as Cyprian. The quiet and repose which the Christians had enjoyed during the last 40 years, had, it seems, greatly corrupted their manners; and therefore Cyprian's first care, after his advancement to the bishopric, was to correct disorders and reform abuses. Luxury was prevalent among them; and many of their women were not so strict as they should be, especially in the article of dress. This occasioned him to draw up his piece *De habitu virginum*, or "concerning the dress of young women;" in which, besides what he says on that particular head, he inculcates many lessons of modesty and sobriety. In the year 249, the emperor Decius began to issue out very severe edicts against the Christians, which particularly affected those upon the coast of Africa; and in the beginning of 250, the heathens, in the circus and amphitheatre of Carthage, insisted loudly upon Cyprian's being thrown to the lions: a common method of destroying the primitive Christians. Cyprian upon this withdrew from his church at Carthage, and fled into retirement, to avoid the fury of the persecutions. He wrote in the place of his retreat, pious and instructive letters to those who had been his hearers; and also to the *libellatici*, a name by which those pusillanimous Christians were called, who procured certificates of the heathen magistrates, to shew that they had complied with the emperor's orders in sacrificing to idols. At his return to Carthage he held several councils on the repentance of those who had fallen during this persecution, and other points of discipline; he opposed the schemes of Novatus and Novatianus; and contended for the rebaptizing of those who had been baptized by heretics. At last he died a martyr in the persecution of Valerian and Gallienus, in 258. Cyprian wrote 81 letters, and several treatises. The best edition of his works are those of Pamelius in 1568; of Rigaltius in 1648; and of Oxford in 1682. His works have also been translated into English by Dr Marshall.

CYPRINUS, in ichthyology, a genus of fishes, belonging to the order of abdominales. The mouth is toothless; there are three rays in the gills; the body

Cyprianus
Cyprianus.

Cyprinus. is smooth and white; and the belly-fins have frequently nine rays. There are 31 species, principally distinguished by the number of rays in the vent-fin. The most remarkable are,

1. The carpio, or carp. This was introduced into England about the year 1514, by *Leonard Maschal*, to whom we are also indebted for that excellent apple the *pippin*. *Ruffia* wants these fish at this day. Sweden has them only in the ponds of people of fashion. They chiefly abound in the rivers and lakes of Polish Prussia, where they are sometimes taken of a vast size. They are there a great article of commerce, and sent in well-boats to Sweden and Russia. The merchants purchase them out of the waters of the noblesse of the country, who draw a good revenue from this article. The ancients do not separate the carp from the sea-fish. They are sometimes found in the harbour of Dantzic between the town and a place called *Helia*.

Carp are very long-lived. *Gesner* brings an instance of one that was near 100 years old. They grow also to a very great size; some authors speak of carp weighing 200 pounds weight, and five feet in length. The carp is a prodigious breeder: its quantity of roe has been sometimes found so great, that when taken out and weighed against the fish itself, the former has been found to preponderate. From the spawn of this fish, caviare is made for the Jews, who hold the sturgeon in abhorrence. The carp is extremely cunning, and on that account is sometimes styled the *river-fox*. They will sometimes leap over the nets and escape that way; at other times they will immerse themselves so deep in the mud as to let the net pass over them. They are also very shy in taking a bait; yet at the spawning-time they are so simple as to suffer themselves to be tickled, handled, and caught by any body that will attempt it. This fish is apt to mix its milk with the roe of other fish; from which is produced a spurious breed, as has been observed in the offspring of the carp and tench, which bore the greatest resemblance to the first. The same has also been observed of the carp and bream.

In Polish Prussia, and many other parts of Germany, the sale of carp constitutes a part of the revenue of the nobility and gentry: so that the proper management of that fish is reduced to a kind of system, founded on the experience of several generations; of the methods there practised, we have an account in the Philosophical Transactions for 1771, art. 37, communicated by Mr J. Reinhold-Forster; who says, he has seen carp treated and maintained according to those methods, "above a yard long, and of 25 pounds weight:" but had no opportunity of ascertaining their age. "In the pond, however, at Charlottenburg, (he adds), a palace belonging to the king of Prussia, I saw more than two or three hundred carp, between two and three feet long; and I was told by the keeper they were between 50 and 60 years standing. They were tame, and came to the shore in order to be fed; they swallowed with ease a piece of white bread, of the size of half a halfpenny roll."—Mr Forster, in this paper, also vouches a most extraordinary circumstance, namely, the possibility of the carp's not only living for a considerable time out of water, but of its growing fat in its new element. The author has seen the ex-

periment successfully tried, and attended to the whole process, in a nobleman's house where he then resided, in the principality of Anhalt-Deßau. The fish being taken out of the water, is wrapped up in a large quantity of wet mofs, spread on a piece of net, which is then gathered into a purse; in such a manner, however, as to allow him room to breathe. The net is then plunged into water, and hung up to the ceiling of a cellar. At first the dipping must be repeated every three or four hours; but afterwards the carp need only to be plunged into the water once in about six or seven hours. Bread soaked in milk is first given him in small quantities. In a short time, the fish will bear more, and grow fat under this seemingly unnatural treatment. Mr Daines Barrington, in a note, confirms a part of the preceding account, by mentioning the practice of a certain fish-monger near Claremarket, who, in the winter, frequently exposes a bushel at least of carp and tench, for sale, in the same dry vessel, for six or seven hours; many of which are not sold, and yet continue in health, though breathing nothing but air, during the time above mentioned, for several days successfully.

2. The barbus, or barbel, is so extremely coarse as to be overlooked by the ancients till the time of the poet Ausonius, who gives it no great character. They frequent the still and deep parts of rivers, and live in society, rooting like swine with their noses in the soft banks. It is so tame as to suffer itself to be taken by the hand; and people have been known to take numbers by diving for them. In summer they move about during night in search of food; but towards autumn, and during winter, confine themselves to the deepest holes. The barbel is about the length of three feet, and will weigh 18 pounds; the belly white; the dorsal fin is armed with a remarkably strong spine, sharply serrated, with which it can inflict a very severe and dangerous wound on the incautious handler, and even do much damage to nets. They are the worst and coarsest of fresh-water fish, and seldom eat but with the poorer sort of people, who sometimes boil them with a bit of bacon to give them a relish. Their roe is very noxious, affecting those who unwarily eat of it with a nausea, vomiting, purging, and a slight swelling.

3. The tinca, or tench, was treated with the same disrespect by the ancients as the barbel; but is now in much more repute. It has by some been called the *physician* of the fish, and its slime has been said to be of so healing a nature, that the wounded fishes apply it as a styptic. In this country it is reckoned a wholesome and delicious food; but the Germans are of a different opinion. By way of contempt they call it the *shoemaker*. *Gesner* even says, that it is insipid and unwholesome. It does not commonly exceed four or five pounds in weight, though some have been known to weigh ten or twenty. They love still waters, and are rarely found in rivers: they are very foolish and easily caught. The tench is thick and short in proportion to its length. The colour of the back is dusky; the dorsal and ventral fins of the same colour; the head, sides, and belly, of a greenish cast, most beautifully mixed with gold, which is in its greatest splendor when the fish is in the highest season.

Cyprinus.

4. The gudgeon is generally found in gentle streams, and is of a small size, the largest not exceeding half a pound weight. They bite eagerly; and are assembled by raking the bed of the river; to this spot they immediately crowd in shoals, in expectation of food.

5. The bream, or bream, is an inhabitant of lakes, or the deep parts of still rivers. It is a fish that is very little esteemed, being extremely infidid.

6. The rutilus, or roach, is a common fish, found in many of the deep still rivers of this country. They are gregarious, keeping in large shoals. It has never been known to exceed five pounds in weight.

7. The leuciscus, or dace, like the roach is gregarious, haunts the same places, is a great breeder, very lively, and during summer is very fond of frolicking near the surface of the water. It never exceeds the weight of a pound and an half: the scales are smaller than those of the roach.

8. The cephalus, or chub, is a very coarse fish and full of bones. It frequents the deep holes of rivers; and in summer commonly lies on the surface beneath the shade of some tree or bush. It is very timid, sinking to the bottom on the least alarm, even at the passing of a shadow; but they will soon resume their former situation. It feeds on worms, caterpillars, grass-hoppers, and other coleopterous insects that happen to fall into the water; and it will even feed on cray-fish. It will rise to a fly. Some of this kind have been known to weigh eight or nine pounds.

9. The alburnus, or bleak. These fish are very common in many of our rivers, and keep together in large shoals. At certain seasons these fish seem to be in great agonies: they tumble about near the surface of the water, and are incapable of swimming far from the place; but in about two hours they recover and disappear. Fish thus affected, the Thames fishermen call *mad* bleaks. They seem to be troubled with a species of *gordius*, or hair-worm, which torments them so, that they rise to the surface and then die. The bleak seldom exceeds five or six inches in length. Artificial pearls are made with the scales of this fish, and probably also with those of the dace. They are beat into a fine powder, then diluted with water, and introduced into a thin glass bubble, which is afterwards filled with wax. The French were the inventors of this art.

During the month of July there appear in the Thames, near Blackwall and Greenwich, innumerable multitudes of small fish, known to the Londoners by the name of *white bait*. They are esteemed very delicious when fried with fine flour, and occasion, during the season, a vast resort of the lower order of epicures to the taverns at the places where they are taken at. There are various suppositions concerning these fishes, all of which terminate in reckoning them the fry of some other fish. Mr Pennant thinks they are of the carp kind, though he cannot determine the species to which they belong. They have a greater similarity to the bleak than to any other, but he thinks they cannot be the young fry of this species; because the bleak is found in many of the British streams, but the white bait only in the Thames. The usual length of this fish is only two inches.

10. The auratus, or golden fish, are now quite na-
VOL. III.

turalized in Britain, and breed as freely in the open waters as the common carp. They were first introduced into England about the year 1691, but were not generally known till 1728, when a great number were brought over, and presented first to Sir Matthew Dekker, and by him circulated round the neighbourhood of London, from whence they have been distributed to most parts of the country. They come originally from China. The most beautiful kinds are taken in a small lake in the province of Che-kyang. Every person of fashion keeps them for amusement, either in porcelain vessels, or in the small basins that decorate the courts of the Chinese houses. The beauty of their colours, and their lively motions give great entertainment, especially to the ladies, whose pleasures, by reason of the cruel policy of that country, are extremely limited. In form of the body, the golden fishes bear a great resemblance to the carp. They have been known in this island to arrive at the length of eight inches; but in their native place they are said to grow to the size of the largest herring. The colours vary greatly; some are marked with a bright blue, with brown, and with bright silver; but the general colour is gold, of a most amazing splendor.

CYPRÆDIUM, the LADY'S SLIPPER, in botany; a genus of the diandria order, belonging to the gynandria class of plants. There are three species; of which only one, *viz.* the calceolus, is a native of Britain. It grows in rough ground, in different parts of the island. The other species are natives of America. None of them are easily propagated in gardens, and therefore must be transplanted from those places where they are natives.

CYPRUS, an island situated in the Levant, or most easterly part of the Mediterranean sea, between 33 and 36 degrees of east longitude, and 30 and 34 of north latitude. In ancient times this island was known by the names of *Acamis*, *Ceraftis*, *Aspalia*, *Amathus*, *Macaria*, *Cryptos*, *Colinia*, *Sphecia*, *Paphia*, *Salamina*, *Ærofa*, and *Cyprus*. The etymologies of these names are neither very easily found, nor are they of much importance. The name by which it was most generally known is that of *Cyprus*, said to be derived from *cyprus*, the name of a shrub with which the island abounded; but what kind of shrub that was, is still disputed.

Cyprus, according to Eratosthenes, was first discovered by the Phœnicians, two or three generations before the days of Aslerius and Minos kings of Crete; that is, according to Sir Isaac Newton's computation, 2006 years before the Christian Æra. - It was at that time so full of wood that it could not be tilled, and the Phœnicians first cut down that wood for melting copper, with which the island abounded; and afterwards, when they began to sail without fear on the Mediterranean, that is, after the Trojan war, they built great navies of the wood produced on the island. Josephus, however, informs us, that the descendants of *Cittim*, the son of Javan, and grandson of Japhet, were the original inhabitants of Cyprus. According to his account, *Cittim*, seeing his brother *Tarshish* settled in Cilicia where he built the city of *Tarfus*, settled with his followers in this opposite island; and there

Cyprus.

ther he or his descendants laid the foundations of the city of *Citium*, which, according to Ptolemy was the most ancient in the island. As Cyprus was too narrow to contain the great numbers who attended him, he left here as many as might serve to people the country, and with the rest passed over into Macedon.

The island of Cyprus was divided among several petty kings till the time of Cyrus the Great. He subdued them all; but left each in possession of his kingdom, obliging them only to pay him an annual tribute, and to send supplies of men, money, and ships when required. The Cyprian princes lived thus subject to the Persians till the reign of Darius Hytaspes, when they attempted to shake off the yoke, but with bad success; their forces being entirely defeated, and themselves again obliged to submit. They made another more successful attempt about the year before Christ 357; but, however, could never totally free themselves from their subjection. It is very probable that they submitted to Alexander the Great, though historians are silent as to that event. On the death of the Macedonian conqueror, the dominion of Cyprus was disputed by Antigonus and Ptolemy the son of Lagos. At last Antigonus prevailed, and the whole island submitted to him about 304 years before Christ. He and his son Demetrius kept possession of it for 11 years, when it was recovered by Ptolemy, and quietly possessed by him and his descendants till 58 years before Christ, when it was most unjustly seized by the Romans. In the time of Augustus, it began to be ranked among the provincial provinces, and to be governed by magistrates sent thither by the senate. In the year 648, it was conquered by the Saracens; but recovered by the Romans in 957. They held it, however, but for a very short time, and the barbarians kept possession of it till the time of the croisades. It was then reduced by the croisaders; and Richard I. of England gave it to the princes of the Lusignan family, who held it till the year 1570. They divided it into 12 provinces, in each of which was a capital city from which the province was denominated. So considerable was the island at this time, that besides the cities above mentioned, and others of less note, it contained 800 villages. In 1570, it was taken by the Turks, and though it hath ever since continued under their tyrannical yoke, is still so considerable as to be governed by a beglerbeg, and seven sangiacs under him.

The air in this island is for the most part very unwholesome, on account of the many fens and marshes with which the country abounds. The soil is an excellent fertile clay; and would produce all the necessaries of life in abundance, if properly cultivated. There are no rivers in the country; but that defect is supplied by abundance of springs. By reason of the uncultivated state of the country, they are also greatly infested with poisonous reptiles of various kinds. The people are extremely ignorant, and lascivious, as indeed they are remarked to have been from the remotest antiquity. Anciently the worship of Venus was established in this island, whence her title among the poets of the *Cyprian queen*; and such an inclination had the inhabitants to become the votaries of this goddess, both in theory and practice, that the young women used to prostitute themselves in her temple in

order to raise themselves portions. Nor are their successors said to be much better at this day. The exports of the island are silks, wool, amber, and wine; the imports are French and Venetian broad cloths; and sometimes a few bales of English manufacture, cutlery wares, sugar, tin, lead, &c.

Knight of Cyprus, an order instituted by Guy de Lusignan, titular king of Jerusalem, to whom Richard I. of England, after conquering this island, made over his right.

CYRANO (Bergerac), a French author, born in Gascony, about the year 1620. He first entered into the army, where his natural courage engaged him frequently in duels in the quality of a second; which, with other rash actions, procured him the title of the *Intrepid*. But the little prospect he saw of preferment made him renounce the trade of war for the exercise of wit. His comic histories of the states and empires in the sun and moon, shew him well acquainted with the Cartesian philosophy and to have a lively imagination. Our lord Orrery classed him with Swift for his turn of humour, which he says the latter adopted and pursued.

CYRENAICA, an ancient kingdom of Africa, corresponding to the present kingdom and desert of Barca and Tripoli. It was originally inhabited by a number of barbarous nations, differing little from great gangs of robbers. Afterwards some colonies from Greece settled here, and Cyrenaica became so powerful a state, that it waged war with Egypt and Carthage, often with success. In the time of Darius Hytaspes, Arceilaus, the reigning prince in Cyrenaica was driven from the throne; on which his mother Pheretima applied for assistance to the king of Cyprus. Her son afterwards returning to Barca, the chief city of Cyrene, was there assassinated, together with his father-in-law. Pheretima finding herself disappointed by the king of Cyprus, applied to Darius Hytaspes, and by the assistance of the Persians reduced Barca. Here she behaved with the utmost cruelty, causing all those who had been concerned in her son's death to be impaled, and the breasts of their wives to be cut off and affixed near them. She is said to have been afterwards devoured by worms; which was looked upon as a divine judgement for her excessive cruelty. The prisoners in the mean time were sent to Darius, who settled them in a district of Bactria, from them called *Barca*. Cyrenaica, however, seems to have remained free till the time of Alexander the Great, who conquered it along with Egypt. Soon after his death the inhabitants recovered their liberty; but were in a short time reduced by Ptolemy king of Egypt. Under these kings it remained till Ptolemy Physcon made it over to his bastard son Apian, who in the 658th year of Rome left it by will to the Romans. The senate permitted all the cities to be governed by their own laws; and this immediately filled the country with tyrants, those who were most potent in every city or district, endeavouring to assume the sovereignty of it. Thus the kingdom was thrown into great confusion; but Lucullus in a good measure restored the public tranquillity on his coming thither during the first Mithridatic war. It was found impossible, however, totally to suppress these disturbances till the country was reduced to the form

Cyprus

Cyrenaica.

of a Roman province, which happened about 20 years after the death of Apian, and 76 before Christ. Upon a revolt, the city of *Cyrene* was ruined by the Romans; but they afterwards rebuilt it. In process of time it fell to the Arabs; and then to the Turks, who are the present masters of it.

CYRENAICS, a sect of ancient philosophers, so called from their founder, Aristippus of Cyrene, a disciple of Socrates.

The great principle of their doctrine was, that the supreme good of man in this life is pleasure; whereby they not only meant a privation of pain, and a tranquillity of mind, but an assemblage of all mental and sensual pleasures, particularly the last.

CYRIL (S^t) bishop of Jerusalem, succeeded Maximus in 350. He was afterward deposed for the crime of exposing to sale the treasures of the church, and applying the money to the support of the poor during a great famine. Under Julian he was restored to his see, and was firmly established to all his old honours and dignities under Theodosius; in which he continued unmolested to his death in 386. The remains of this father consist only of 23 catecheses, and one letter to the emperor Constantius.

CYRILL (S^t) patriarch of Alexandria, succeeded Theophilus, his uncle, in 412. Scarce was he installed, when he began to exert his authority with great vigour; he drove the Novatians and Jews from Alexandria, permitting their wealth and synagogues to be taken from them. This proceeding highly displeased Orestes, the governor of the city, who saw that if the bishop's authority was not soon suppressed it might grow too strong for that of the magistrate. Upon which a kind of civil war broke out between Orestes and the bishop; many tumults were raised, and some battles fought in the very streets of Alexandria. St Cyrill also distinguished himself by his zeal against Nestorius bishop of Constantinople, who, in some of his homilies, had asserted that the virgin Mary ought not to be called the mother of God. The dispute at first proved unfavourable to Cyrill, whose opinion was not only condemned, but himself deprived of his bishopric and thrown into prison. But he was soon after released, and gained a complete victory over Nestorius, who in 431 was deposed from his see of Constantinople. Cyrill returned to his see at Constantinople, where he died in 444. St Cyrill also wrote against Theodorus of Moplaesta, Diodorus of Tarsus, and Julian the apostate. He composed commentaries on St John's gospel, and wrote several other books. His works were published in Greek and Latin in 1638, in six volumes folio.

CYRUS I. and II. kings of Persia. See (*History of*) PERSIA.

CYST, the bag, or tunic, including all incysted tumors, as the scirrhus, atheroma, steatoma, melicer, &c.

CYSTIC, in anatomy, a name given to two arteries and two veins.

CYSTIC DUCT. See ANATOMY, n^o 358, c.

CYTHEREA, a name of Venus, so called from Cythera an island of Greece, where poets say she was formed of the froth of the sea. She had a sumptuous temple there consecrated to her under the name of Venus Urania.

CYTISUS, TREE REPOIL: a genus of the decandria order, belonging to the diadelphia class of plants.

There are 11 species, of which the most remarkable are, 1. The laburnum, or large deciduous cytissus, hath a large upright tree-stem, branching into a full-spreading head, 20 or 30 feet high, having smooth greenish branches, oblong oval entire leaves, growing by threes on long slender foot-stalks; and from the sides of all the branches, numerous yellow flowers collected into long spikes, hanging loosely downward, and appearing in May. 2. The sessilifolius, often called *cytissus secundus clusii*, have a low shrubby stem dividing into numerous erect brownish branches, forming a bushy head five or six feet high, garnished with small oval leaves growing by threes; some on very short foot-stalks, others sitting close; and bright yellow flowers in short erect spikes at the ends of the branches, appearing in June. 3. The nigricans grows with a short shrubby stem, dividing low into many erect slender branches, forming a bushy head four or five feet high, with oblong, oval, trifoliate leaves, and yellow flowers, terminating all the branches in upright spikes, appearing in July. 4. The hirsutus, or hairy evergreen: Neapolitan cytissus, rises with an upright shrubby grey stem, sending out many erect greenish hairy branches, forming a fine head six or eight feet high, closely garnished with small hairy trifoliate leaves on short foot-stalks, and yellow flowers from the sides of the branches in short pendulous spikes, appearing in June. 5. The Austriacus, Austrian, or Tartarian evergreen cytissus, hath a shrubby stem, dividing low into many greenish branches, forming a bushy head three or four feet high, having smooth whitish-green leaves, and bright yellow flowers in close umbellate heads at the ends of the branches, having a cluster of leaves under each head. These flowers appear in May.

Culture, &c. All the sorts are hardy, and will prosper in any common soil and exposure; though, as the hirsutus is sometimes affected by severe frost, it should have a dry soil, and a somewhat sheltered situation. They may all be propagated by seeds or cuttings, and all the culture they require in the nursery is to have the ground kept clear from weeds, and dug annually between the rows. Though they are generally considered only as ornamental shrubs, yet the first species, if originally trained to a stem, and suffered to stand, will grow to the size of pretty large timber trees. They grow naturally on the Alps, the mountains of Dauphine, and the highlands of Scotland; and the timber being very hard, and taking a fine polish, is frequently used for making chairs, tables, bed-steads, and other furniture; and is said to equal the finest mahogany in beauty. A species of cytissus, called by Linnæus *cytissus cajan*, is known in the West Indies, where it is a native, by the name of the *pigeon-pea*, from the seeds being the common food of these birds in that part of the world. These seeds are also sometimes used as food for the human species; and as they are of a very binding quality, afford a wholesome nourishment during the wet season, when dysenteries are so frequent.

CZACKTHURN, a strong town of Germany, in Austria, and near the frontiers of Hungary. It is seated between the rivers Drave and Muhr, in E. Long.

- Czar** Long. 17. 19. N. Lat. 46. 24.
- CZENSTOKOW** **CZAR**, a title of honour assumed by the great dukes, or, as they are now styled, *emperors of Russia*. Beckman makes no doubt but they took this title, by corruption, from *Cæsar*, emperor; and accordingly they bear an eagle, as the symbol of their empire, and the word *Cæsar* in their arms.
- CZASLAU**, a town of Bohemia, and capital of a circle of the same name. Here is the highest tower in all Bohemia; and near this place the king of Prussia gained a victory over the Austrians in 1742. It is seated on the river Crudenka, in E. Long. 15. 33. N. Lat. 49. 50.
- CZENSTOKOW**, a town of Poland in the palatinate of Cracovia, with a fort, in which they keep a rich treasure, called "the treasure of the virgin Mary." The pilgrims flock hither so much for the sake of a convent near it, that it is called the *Loretto* of Poland. The town is situated on the river Warta, in E. Long. 19. 15. N. Lat. 50. 48.
- CZERNIC**, a town of Carniola, in Austria, situated in E. Long. 15. 0. N. Lat. 46. 12. It is remarkable for its lake, for a particular description of which see the article *ZIRCHNITZER*.
- CZERNIKOU**, a considerable town of Muscovy, and capital of a duchy of the same name, with a castle. It is seated on the river Dezna, in E. Long. 32. 13. N. Lat. 51. 20.
- CZONGRODT**, a town of upper Hungary, and capital of a territory of the same name, at the confluence of the rivers Teisse and Keres. E. Long. 20. 57. N. Lat. 46. 50.
